Pixyz is a library for developing deep generative models in a more concise, intuitive and extendable way!

# CHAPTER 1

## pixyz.distributions (Distribution API)

### 1.1 Distribution

```
class pixyz.distributions.distributions.Distribution(var, cond_var=[], name='p',
                                                     features_shape=torch.Size([]),
                                                     atomic=True)
```

Bases: torch.nn.modules.module.Module

Distribution class. In Pixyz, all distributions are required to inherit this class.

#### Examples

```
>>> import torch
>>> from torch.nn import functional as F
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[x],
...               features_shape=[64], name="p1")
>>> print(p1)
Distribution:
p_{1}(x)
Network architecture:
Normal(
    name=p_{1}, distribution_name=Normal,
    var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([64])
    (loc): torch.Size([1, 64])
    (scale): torch.Size([1, 64])
)
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc=y, scale=torch.tensor(1.), var=[x], cond_var=[y],
...               features_shape=[64], name="p2")
>>> print(p2)
```

(continues on next page)

(continued from previous page)

```
Distribution:
p_{2}(x|y)
Network architecture:
Normal(
    name=p_{2}, distribution_name=Normal,
    var=['x'], cond_var=['y'], input_var=['y'], features_shape=torch.Size([64])
    (scale): torch.Size([1, 64])
)
```

```
>>> # Conditional distribution (by neural networks)
>>> class P(Normal):
...     def __init__(self):
...         super().__init__(var=["x"], cond_var=["y"], name="p3")
...         self.model_loc = nn.Linear(128, 64)
...         self.model_scale = nn.Linear(128, 64)
...     def forward(self, y):
...         return {"loc": self.model_loc(y), "scale": F.softplus(self.model_
...         scale(y))}
>>> p3 = P()
>>> print(p3)
Distribution:
p_{3}(x|y)
Network architecture:
P(
    name=p_{3}, distribution_name=Normal,
    var=['x'], cond_var=['y'], input_var=['y'], features_shape=torch.Size([])
    (model_loc): Linear(in_features=128, out_features=64, bias=True)
    (model_scale): Linear(in_features=128, out_features=64, bias=True)
)
```

`__init__(var, cond_var=[], name='p', features_shape=torch.Size([]), atomic=True)`

#### Parameters

- **var** (list of str) – Variables of this distribution.
- **cond\_var** (list of str, defaults to []) – Conditional variables of this distribution. In case that cond\_var is not empty, we must set the corresponding inputs to sample variables.
- **name** (str, defaults to “p”) – Name of this distribution. This name is displayed in `prob_text` and `prob_factorized_text`.
- **features\_shape** (torch.Size or list, defaults to torch.Size()) – Shape of dimensions (features) of this distribution.

**graph**

**distribution\_name**

Name of this distribution class.

**Type** str

**name**

Name of this distribution displayed in `prob_text` and `prob_factorized_text`.

**Type** str

**var**

Variables of this distribution.

**Type** list

**cond\_var**

Conditional variables of this distribution.

**Type** list

**input\_var**

Input variables of this distribution. Normally, it has same values as `cond_var`.

**Type** list

**prob\_text**

Return a formula of the (joint) probability distribution.

**Type** str

**prob\_factorized\_text**

Return a formula of the factorized probability distribution.

**Type** str

**prob\_joint\_factorized\_and\_text**

Return a formula of the factorized and the (joint) probability distributions.

**Type** str

**features\_shape**

Shape of features of this distribution.

**Type** torch.Size or list

**sample**(*x\_dict*={}, *batch\_n*=None, *sample\_shape*=torch.Size([]), *return\_all*=True, *reparam*=False)

Sample variables of this distribution. If `cond_var` is not empty, you should set inputs as dict.

**Parameters**

- **x\_dict** (torch.Tensor, list, or dict, defaults to {}) – Input variables.
- **batch\_n** (int, defaults to None.) – Set batch size of parameters.
- **sample\_shape** (list or NoneType, defaults to torch.Size()) – Shape of generating samples.
- **return\_all** (bool, defaults to True) – Choose whether the output contains input variables.
- **reparam** (bool, defaults to False.) – Choose whether we sample variables with re-parameterized trick.

**Returns** **output** – Samples of this distribution.

**Return type** dict

**Examples**

```
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p = Normal(loc=0, scale=1, var=["x"], features_shape=[10, 2])
>>> print(p)
Distribution:
p(x)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
```

(continues on next page)

(continued from previous page)

```

var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([10, 2])
(loc): torch.Size([1, 10, 2])
(scale): torch.Size([1, 10, 2])
)
>>> p.sample()["x"].shape # (batch_n=1, features_shape)
torch.Size([1, 10, 2])
>>> p.sample(batch_n=20)["x"].shape # (batch_n, features_shape)
torch.Size([20, 10, 2])
>>> p.sample(batch_n=20, sample_shape=[40, 30])["x"].shape # (sample_shape, ↴
batch_n, features_shape)
torch.Size([40, 30, 20, 10, 2])

```

```

>>> # Conditional distribution
>>> p = Normal(loc="y", scale=1., var=["x"], cond_var=["y"], features_
↳shape=[10])
>>> print(p)
Distribution:
p(x|y)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=['y'], input_var=['y'], features_shape=torch.
↳Size([10])
    (scale): torch.Size([1, 10])
)
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> sample_a = torch.randn(1, 10) # Psuedo data
>>> sample = p.sample({"y": sample_y})
>>> print(sample) # input_var + var # doctest: +SKIP
{'y': tensor([-0.5182,  0.3484,  0.9042,  0.1914,  0.6905,
             -1.0859, -0.4433, -0.0255,  0.8198,  0.4571])),
 'x': tensor([-0.7205, -1.3996,  0.5528, -0.3059,  0.5384,
             -1.4976, -0.1480,  0.0841,  0.3321,  0.5561]))}
>>> sample = p.sample({"y": sample_y, "a": sample_a}) # Redundant input ("a")
>>> print(sample) # input_var + var + "a" (redundant input) # doctest: +SKIP
{'y': tensor([1.3582, -1.1151, -0.8111,  1.0630,  1.1633,
             0.3855,  2.6324, -0.9357, -0.8649, -0.6015])),
 'a': tensor([-0.1874,  1.7958, -1.4084, -2.5646,  1.0868,
             -0.7523, -0.0852, -2.4222, -0.3914, -0.9755])),
 'x': tensor([-0.3272, -0.5222, -1.3659,  1.8386,  2.3204,
             0.3686,  0.6311, -1.1208,  0.3656, -0.6683]))}

```

**has\_reparam****sample\_mean (x\_dict={})**

Return the mean of the distribution.

**Parameters** **x\_dict** (dict, defaults to {}) – Parameters of this distribution.**Examples**

```

>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"]),

```

(continues on next page)

(continued from previous page)

```

...           features_shape=[10], name="p1")
>>> mean = p1.sample_mean()
>>> print(mean)
tensor([0., 0., 0., 0., 0., 0., 0., 0., 0., 0.])

>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> mean = p2.sample_mean({"y": sample_y})
>>> print(mean) # doctest: +SKIP
tensor([-0.2189, -1.0310, -0.1917, -0.3085,  1.5190, -0.9037,  1.2559,  0.
       1410,
       1.2810, -0.6681])

```

**sample\_variance**(*x\_dict*={})

Return the variance of the distribution.

**Parameters** **x\_dict** (dict, defaults to {}) – Parameters of this distribution.**Examples**

```

>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...               features_shape=[10], name="p1")
>>> var = p1.sample_variance()
>>> print(var)
tensor([[1., 1., 1., 1., 1., 1., 1., 1., 1., 1.]])

```

```

>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> var = p2.sample_variance({"y": sample_y})
>>> print(var) # doctest: +SKIP
tensor([[1., 1., 1., 1., 1., 1., 1., 1., 1., 1.]])

```

**get\_log\_prob**(*x\_dict*, *sum\_features*=True, *feature\_dims*=None)

Giving variables, this method returns values of log-pdf.

**Parameters**

- **x\_dict** (dict) – Input variables.
- **sum\_features** (bool, defaults to True) – Whether the output is summed across some dimensions which are specified by *feature\_dims*.
- **feature\_dims** (list or NoneType, defaults to None) – Set dimensions to sum across the output.

**Returns** **log\_prob** – Values of log-probability density/mass function.**Return type** torch.Tensor

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...               features_shape=[10], name="p1")
>>> sample_x = torch.randn(1, 10) # Psuedo data
>>> log_prob = p1.log_prob({"x": sample_x})
>>> print(log_prob) # doctest: +SKIP
tensor([-16.1153])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> log_prob = p2.log_prob({"x": sample_x, "y": sample_y})
>>> print(log_prob) # doctest: +SKIP
tensor([-21.5251])
```

**get\_entropy** (*x\_dict*={}, *sum\_features*=True, *feature\_dims*=None)

Giving variables, this method returns values of entropy.

### Parameters

- **x\_dict** (dict, defaults to {}) – Input variables.
- **sum\_features** (bool, defaults to True) – Whether the output is summed across some dimensions which are specified by *feature\_dims*.
- **feature\_dims** (list or NoneType, defaults to None) – Set dimensions to sum across the output.

**Returns** **entropy** – Values of entropy.

**Return type** torch.Tensor

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...               features_shape=[10], name="p1")
>>> entropy = p1.get_entropy()
>>> print(entropy)
tensor([14.1894])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> entropy = p2.get_entropy({"y": sample_y})
>>> print(entropy)
tensor([14.1894])
```

**log\_prob** (*sum\_features*=True, *feature\_dims*=None)

Return an instance of *pixyz.losses.LogProb*.

## Parameters

- **sum\_features** (bool, defaults to True) – Whether the output is summed across some axes (dimensions) which are specified by `feature_dims`.
- **feature\_dims** (list or NoneType, defaults to None) – Set axes to sum across the output.

**Returns** An instance of `pixyz.losses.LogProb`

**Return type** `pixyz.losses.LogProb`

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[ "x" ],
...               features_shape=[10], name="p1")
>>> sample_x = torch.randn(1, 10) # Psuedo data
>>> log_prob = p1.log_prob().eval({ "x": sample_x })
>>> print(log_prob) # doctest: +SKIP
tensor([-16.1153])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=[ "x" ], cond_var=[ "y" ],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> log_prob = p2.log_prob().eval({ "x": sample_x, "y": sample_y })
>>> print(log_prob) # doctest: +SKIP
tensor([-21.5251])
```

**prob** (`sum_features=True, feature_dims=None`)

Return an instance of `pixyz.losses.Prob`.

## Parameters

- **sum\_features** (bool, defaults to True) – Choose whether the output is summed across some axes (dimensions) which are specified by `feature_dims`.
- **feature\_dims** (list or NoneType, defaults to None) – Set dimensions to sum across the output. (Note: this parameter is not used for now.)

**Returns** An instance of `pixyz.losses.Prob`

**Return type** `pixyz.losses.Prob`

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[ "x" ],
...               features_shape=[10], name="p1")
>>> sample_x = torch.randn(1, 10) # Psuedo data
>>> prob = p1.prob().eval({ "x": sample_x })
>>> print(prob) # doctest: +SKIP
tensor([4.0933e-07])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> prob = p2.prob().eval({"x": sample_x, "y": sample_y})
>>> print(prob) # doctest: +SKIP
tensor([2.9628e-09])
```

### `forward(*args, **kwargs)`

When this class is inherited by DNNs, this method should be overrided.

### `replace_var(**replace_dict)`

Return an instance of `pixyz.distributions.ReplaceVarDistribution`.

**Parameters** `replace_dict` (`dict`) – Dictionary.

**Returns** An instance of `pixyz.distributions.ReplaceVarDistribution`

**Return type** `pixyz.distributions.ReplaceVarDistribution`

### `marginalize_var(marginalize_list)`

Return an instance of `pixyz.distributions.MarginalizeVarDistribution`.

**Parameters** `marginalize_list` (`list` or other) – Variables to marginalize.

**Returns** An instance of `pixyz.distributions.MarginalizeVarDistribution`

**Return type** `pixyz.distributions.MarginalizeVarDistribution`

### `extra_repr()`

Set the extra representation of the module

To print customized extra information, you should re-implement this method in your own modules. Both single-line and multi-line strings are acceptable.

## 1.2 Exponential families

### 1.2.1 Normal

```
class pixyz.distributions.Normal(var=['x'], cond_var=[], name='p', features_shape=torch.Size([]), loc=None, scale=None)
```

Bases: `pixyz.distributions.DistributionBase`

Normal distribution parameterized by `loc` and `scale`.

#### `params_keys`

Return the list of parameter names for this distribution.

**Type** list

#### `distribution_torch_class`

Return the class of PyTorch distribution.

#### `distribution_name`

Name of this distribution class.

**Type** str

#### `has_reparam`

## 1.2.2 Laplace

```
class pixyz.distributions.Laplace(var=['x'], cond_var=[], name='p', features_shape=torch.Size([]), loc=None, scale=None)
Bases: pixyz.distributions.distributions.DistributionBase
Laplace distribution parameterized by loc and scale.

params_keys
    Return the list of parameter names for this distribution.

Type list

distribution_torch_class
    Return the class of PyTorch distribution.

distribution_name
    Name of this distribution class.

Type str

has_reparam
```

## 1.2.3 Bernoulli

```
class pixyz.distributions.Bernoulli(var=['x'], cond_var=[], name='p', features_shape=torch.Size([]), probs=None)
Bases: pixyz.distributions.distributions.DistributionBase
Bernoulli distribution parameterized by probs.

params_keys
    Return the list of parameter names for this distribution.

Type list

distribution_torch_class
    Return the class of PyTorch distribution.

distribution_name
    Name of this distribution class.

Type str

has_reparam
```

## 1.2.4 RelaxedBernoulli

```
class pixyz.distributions.RelaxedBernoulli(var=['x'], cond_var=[], name='p', features_shape=torch.Size([]), temperature=tensor(0.1000), probs=None)
Bases: pixyz.distributions.exponential_distributions.Bernoulli
Relaxed (re-parameterizable) Bernoulli distribution parameterized by probs and temperature.

params_keys
    Return the list of parameter names for this distribution.

Type list

distribution_torch_class
    Use relaxed version only when sampling
```

### **distribution\_name**

Name of this distribution class.

**Type** str

### **set\_dist** (*x\_dict*={}, *batch\_n*=None, *sampling*=False, \*\**kwargs*)

Set dist as PyTorch distributions given parameters.

This requires that *params\_keys* and *distribution\_torch\_class* are set.

#### Parameters

- **x\_dict** (dict, defaults to {}) – Parameters of this distribution.
- **batch\_n** (int, defaults to None.) – Set batch size of parameters.
- **sampling** (bool defaults to False.) – If it is false, the distribution will not be relaxed to compute log\_prob.
- **\*\*kwargs** – Arbitrary keyword arguments.

### **sample** (*x\_dict*={}, *batch\_n*=None, *sample\_shape*=torch.Size([]), *return\_all*=True, *reparam*=False)

Sample variables of this distribution. If *cond\_var* is not empty, you should set inputs as dict.

#### Parameters

- **x\_dict** (torch.Tensor, list, or dict, defaults to {}) – Input variables.
- **batch\_n** (int, defaults to None.) – Set batch size of parameters.
- **sample\_shape** (list or NoneType, defaults to torch.Size()) – Shape of generating samples.
- **return\_all** (bool, defaults to True) – Choose whether the output contains input variables.
- **reparam** (bool, defaults to False.) – Choose whether we sample variables with reparameterized trick.

**Returns** **output** – Samples of this distribution.

**Return type** dict

## Examples

```
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p = Normal(loc=0, scale=1, var=["x"], features_shape=[10, 2])
>>> print(p)
Distribution:
p(x)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([10, 2])
    (loc): torch.Size([1, 10, 2])
    (scale): torch.Size([1, 10, 2])
)
>>> p.sample()["x"].shape # (batch_n=1, features_shape)
torch.Size([1, 10, 2])
>>> p.sample(batch_n=20)["x"].shape # (batch_n, features_shape)
torch.Size([20, 10, 2])
```

(continues on next page)

(continued from previous page)

```
>>> p.sample(batch_n=20, sample_shape=[40, 30])["x"].shape # (sample_shape, batch_n, features_shape)
torch.Size([40, 30, 20, 10, 2])
```

```
>>> # Conditional distribution
>>> p = Normal(loc="y", scale=1., var=["x"], cond_var=["y"], features_
->shape=[10])
>>> print(p)
Distribution:
p(x|y)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=['y'], input_var=['y'], features_shape=torch.
->Size([10])
    (scale): torch.Size([1, 10])
)
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> sample_a = torch.randn(1, 10) # Psuedo data
>>> sample = p.sample({"y": sample_y})
>>> print(sample) # input_var + var # doctest: +SKIP
{'y': tensor([-0.5182,  0.3484,  0.9042,  0.1914,  0.6905,
             -1.0859, -0.4433, -0.0255,  0.8198,  0.4571]),
 'x': tensor([-0.7205, -1.3996,  0.5528, -0.3059,  0.5384,
             -1.4976, -0.1480,  0.0841,  0.3321,  0.5561])}
>>> sample = p.sample({"y": sample_y, "a": sample_a}) # Redundant input ("a")
>>> print(sample) # input_var + var + "a" (redundant input) # doctest: +SKIP
{'y': tensor([ 1.3582, -1.1151, -0.8111,  1.0630,  1.1633,
              0.3855,  2.6324, -0.9357, -0.8649, -0.6015]),
 'a': tensor([-0.1874,  1.7958, -1.4084, -2.5646,  1.0868,
              -0.7523, -0.0852, -2.4222, -0.3914, -0.9755]),
 'x': tensor([-0.3272, -0.5222, -1.3659,  1.8386,  2.3204,
              0.3686,  0.6311, -1.1208,  0.3656, -0.6683])}
```

**has\_reparam**

## 1.2.5 FactorizedBernoulli

```
class pixyz.distributions.FactorizedBernoulli(var=['x'], cond_var=[], name='p',
                                              features_shape=torch.Size([]),
                                              probs=None)
```

Bases: pixyz.distributions.exponential\_distributions.Bernoulli

Factorized Bernoulli distribution parameterized by probs.

### References

[Vedantam+ 2017] Generative Models of Visually Grounded Imagination

#### **distribution\_name**

Name of this distribution class.

**Type** str

#### **get\_log\_prob(x\_dict)**

Giving variables, this method returns values of log-pdf.

### Parameters

- **x\_dict** (*dict*) – Input variables.
- **sum\_features** (*bool*, defaults to True) – Whether the output is summed across some dimensions which are specified by *feature\_dims*.
- **feature\_dims** (*list* or *NoneType*, defaults to None) – Set dimensions to sum across the output.

**Returns** `log_prob` – Values of log-probability density/mass function.

**Return type** `torch.Tensor`

### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...               features_shape=[10], name="p1")
>>> sample_x = torch.randn(1, 10) # Psuedo data
>>> log_prob = p1.log_prob({"x": sample_x})
>>> print(log_prob) # doctest: +SKIP
tensor([-16.1153])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> log_prob = p2.log_prob({"x": sample_x, "y": sample_y})
>>> print(log_prob) # doctest: +SKIP
tensor([-21.5251])
```

## 1.2.6 Categorical

```
class pixyz.distributions.Categorical(var=['x'], cond_var=[], name='p', features_shape=torch.Size([]), probs=None)
```

Bases: `pixyz.distributions.distribution.DistributionBase`

Categorical distribution parameterized by `probs`.

#### params\_keys

Return the list of parameter names for this distribution.

**Type** list

#### distribution\_torch\_class

Return the class of PyTorch distribution.

#### distribution\_name

Name of this distribution class.

**Type** str

#### has\_reparam

## 1.2.7 RelaxedCategorical

```
class pixyz.distributions.RelaxedCategorical(var=['x'], cond_var=[], name='p', features_shape=torch.Size([]), temperature=tensor(0.1000), probs=None)
```

Bases: pixyz.distributions.exponential\_distributions.Categorical

Relaxed (re-parameterizable) categorical distribution parameterized by `probs` and `temperature`. Notes: a shape of `temperature` should contain the event shape of this Categorical distribution.

### params\_keys

Return the list of parameter names for this distribution.

**Type** list

### distribution\_torch\_class

Use relaxed version only when sampling

### distribution\_name

Name of this distribution class.

**Type** str

### set\_dist(x\_dict={}, batch\_n=None, sampling=False, \*\*kwargs)

Set `dist` as PyTorch distributions given parameters.

This requires that `params_keys` and `distribution_torch_class` are set.

#### Parameters

- **x\_dict** (dict, defaults to {}) – Parameters of this distribution.
- **batch\_n** (int, defaults to None.) – Set batch size of parameters.
- **sampling** (bool defaults to False.) – If it is false, the distribution will not be relaxed to compute `log_prob`.
- **\*\*kwargs** – Arbitrary keyword arguments.

### sample(x\_dict={}, batch\_n=None, sample\_shape=torch.Size([]), return\_all=True, reparam=False)

Sample variables of this distribution. If `cond_var` is not empty, you should set inputs as `dict`.

#### Parameters

- **x\_dict** (torch.Tensor, list, or dict, defaults to {}) – Input variables.
- **batch\_n** (int, defaults to None.) – Set batch size of parameters.
- **sample\_shape** (list or NoneType, defaults to `torch.Size()`) – Shape of generating samples.
- **return\_all** (bool, defaults to True) – Choose whether the output contains input variables.
- **reparam** (bool, defaults to False.) – Choose whether we sample variables with re-parameterized trick.

**Returns** `output` – Samples of this distribution.

**Return type** dict

## Examples

```
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p = Normal(loc=0, scale=1, var=["x"], features_shape=[10, 2])
>>> print(p)
Distribution:
p(x)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([10, 2])
    (loc): torch.Size([1, 10, 2])
    (scale): torch.Size([1, 10, 2])
)
>>> p.sample()["x"].shape # (batch_n=1, features_shape)
torch.Size([1, 10, 2])
>>> p.sample(batch_n=20)["x"].shape # (batch_n, features_shape)
torch.Size([20, 10, 2])
>>> p.sample(batch_n=20, sample_shape=[40, 30])["x"].shape # (sample_shape, ↴
    batch_n, features_shape)
torch.Size([40, 30, 20, 10, 2])
```

```
>>> # Conditional distribution
>>> p = Normal(loc="y", scale=1., var=["x"], cond_var=["y"], features_
    ↴shape=[10])
>>> print(p)
Distribution:
p(x|y)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=['y'], input_var=['y'], features_shape=torch.
    ↴Size([10])
    (scale): torch.Size([1, 10])
)
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> sample_a = torch.randn(1, 10) # Psuedo data
>>> sample = p.sample({"y": sample_y})
>>> print(sample) # input_var + var # doctest: +SKIP
{'y': tensor([-0.5182,  0.3484,  0.9042,  0.1914,  0.6905,
             -1.0859, -0.4433, -0.0255,  0.8198,  0.4571])),
 'x': tensor([-0.7205, -1.3996,  0.5528, -0.3059,  0.5384,
             -1.4976, -0.1480,  0.0841,  0.3321,  0.5561]))}
>>> sample = p.sample({"y": sample_y, "a": sample_a}) # Redundant input ("a")
>>> print(sample) # input_var + var + "a" (redundant input) # doctest: +SKIP
{'y': tensor([ 1.3582, -1.1151, -0.8111,  1.0630,  1.1633,
              0.3855,  2.6324, -0.9357, -0.8649, -0.6015])),
 'a': tensor([-0.1874,  1.7958, -1.4084, -2.5646,  1.0868,
             -0.7523, -0.0852, -2.4222, -0.3914, -0.9755])),
 'x': tensor([-0.3272, -0.5222, -1.3659,  1.8386,  2.3204,
              0.3686,  0.6311, -1.1208,  0.3656, -0.6683]))}
```

`has_reparam`

### 1.2.8 Beta

```
class pixyz.distributions.Beta (var=['x'], cond_var=[], name='p', features_shape=torch.Size([]), concentration1=None, concentration0=None)
Bases: pixyz.distributions.distributions.DistributionBase
Beta distribution parameterized by concentration1 and concentration0.

params_keys
    Return the list of parameter names for this distribution.

    Type list

distribution_torch_class
    Return the class of PyTorch distribution.

distribution_name
    Name of this distribution class.

    Type str

has_reparam
```

### 1.2.9 Dirichlet

```
class pixyz.distributions.Dirichlet (var=['x'], cond_var=[], name='p', features_shape=torch.Size([]), concentration=None)
Bases: pixyz.distributions.distributions.DistributionBase
Dirichlet distribution parameterized by concentration.

params_keys
    Return the list of parameter names for this distribution.

    Type list

distribution_torch_class
    Return the class of PyTorch distribution.

distribution_name
    Name of this distribution class.

    Type str

has_reparam
```

### 1.2.10 Gamma

```
class pixyz.distributions.Gamma (var=['x'], cond_var=[], name='p', features_shape=torch.Size([]), concentration=None, rate=None)
Bases: pixyz.distributions.distributions.DistributionBase
Gamma distribution parameterized by concentration and rate.

params_keys
    Return the list of parameter names for this distribution.

    Type list

distribution_torch_class
    Return the class of PyTorch distribution.
```

**distribution\_name**  
Name of this distribution class.  
**Type** str  
**has\_reparam**

## 1.3 Complex distributions

### 1.3.1 MixtureModel

**class** pixyz.distributions.MixtureModel (*distributions, prior, name='p'*)  
Bases: *pixyz.distributions.distributions.Distribution*

Mixture models.

$$p(x) = \sum_i p(x|z=i)p(z=i)$$

#### Examples

```
>>> from pixyz.distributions import Normal, Categorical
>>> from pixyz.distributions.mixture_distributions import MixtureModel
>>> z_dim = 3 # the number of mixture
>>> x_dim = 2 # the input dimension.
>>> distributions = [] # the list of distributions
>>> for i in range(z_dim):
...     loc = torch.randn(x_dim) # initialize the value of location (mean)
...     scale = torch.empty(x_dim).fill_(1.) # initialize the value of scale
...     distributions.append(Normal(loc=loc, scale=scale, var=['x'], name="p_%d"
...     %i))
>>> probs = torch.empty(z_dim).fill_(1. / z_dim) # initialize the value of
...     probabilities
>>> prior = Categorical(probs=probs, var=['z'], name="prior")
>>> p = MixtureModel(distributions=distributions, prior=prior)
>>> print(p)
Distribution:
p(x) = p_{0}(x|z=0)prior(z=0) + p_{1}(x|z=1)prior(z=1) + p_{2}(x|z=2)prior(z=2)
Network architecture:
MixtureModel(
    name=p, distribution_name=Mixture Model,
    var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([]),
    distributions: ModuleList(
        (0): Normal(
            name=p_{0}, distribution_name=Normal,
            var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([2]),
            (loc): torch.Size([1, 2]),
            (scale): torch.Size([1, 2])
        )
        (1): Normal(
            name=p_{1}, distribution_name=Normal,
            var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([2]),
            (loc): torch.Size([1, 2]),
            (scale): torch.Size([1, 2])
        )
    )
)
```

(continues on next page)

(continued from previous page)

```

        )
    (2): Normal(
        name=p_{2}, distribution_name=Normal,
        var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([2])
        (loc): torch.Size([1, 2])
        (scale): torch.Size([1, 2])
    )
)
(prior): Categorical(
    name=prior, distribution_name=Categorical,
    var=['z'], cond_var=[], input_var=[], features_shape=torch.Size([3])
    (probs): torch.Size([1, 3])
)
)

```

**`__init__(distributions, prior, name='p')`****Parameters**

- **distributions** (*list*) – List of distributions.
- **prior** (*pixyz.Distribution.Categorical*) – Prior distribution of latent variable (i.e., a contribution rate). This should be a categorical distribution and the number of its category should be the same as the length of `distributions`.
- **name** (*str*, defaults to “p”) – Name of this distribution. This name is displayed in `prob_text` and `prob_factorized_text`.

**`hidden_var`**

Hidden variables of this distribution.

**Type** list**`prob_factorized_text`**

Return a formula of the factorized probability distribution.

**Type** str**`distribution_name`**

Name of this distribution class.

**Type** str**`posterior(name=None)`**

**sample** (*x\_dict={}*, *batch\_n=None*, *sample\_shape=torch.Size([])*, *return\_all=True*, *return\_hidden=False*, *\*\*kwargs*)

Sample variables of this distribution. If `cond_var` is not empty, you should set inputs as `dict`.

**Parameters**

- **x\_dict** (*torch.Tensor*, *list*, or *dict*, defaults to `{}`) – Input variables.
- **batch\_n** (*int*, defaults to `None`.) – Set batch size of parameters.
- **sample\_shape** (*list* or *NoneType*, defaults to `torch.Size()`) – Shape of generating samples.
- **return\_all** (*bool*, defaults to `True`) – Choose whether the output contains input variables.
- **reparam** (*bool*, defaults to `False`.) – Choose whether we sample variables with re-parameterized trick.

**Returns output** – Samples of this distribution.

**Return type** dict

## Examples

```
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p = Normal(loc=0, scale=1, var=["x"], features_shape=[10, 2])
>>> print(p)
Distribution:
p(x)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([10, 2])
    (loc): torch.Size([1, 10, 2])
    (scale): torch.Size([1, 10, 2])
)
>>> p.sample()["x"].shape # (batch_n=1, features_shape)
torch.Size([1, 10, 2])
>>> p.sample(batch_n=20)["x"].shape # (batch_n, features_shape)
torch.Size([20, 10, 2])
>>> p.sample(batch_n=20, sample_shape=[40, 30])["x"].shape # (sample_shape, ↴
batch_n, features_shape)
torch.Size([40, 30, 20, 10, 2])
```

```
>>> # Conditional distribution
>>> p = Normal(loc="y", scale=1., var=["x"], cond_var=["y"], features_
shape=[10])
>>> print(p)
Distribution:
p(x|y)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=['y'], input_var=['y'], features_shape=torch.
Size([10])
    (scale): torch.Size([1, 10])
)
>>> sample_y = torch.randn(1, 10) # Psuedo data

```

**has\_reparam****get\_log\_prob** (*x\_dict*, *return\_hidden=False*, *\*\*kwargs*)Evaluate log-pdf, log p(x) (if *return\_hidden=False*) or log p(x, z) (if *return\_hidden=True*).**Parameters**

- **x\_dict** (*dict*) – Input variables (including *var*).
- **return\_hidden** (*bool*, defaults to False) –

**Returns****log\_prob** – The log-pdf value of x.**return\_hidden = 0** : dim=0 : the size of batch**return\_hidden = 1** : dim=0 : the number of mixture

dim=1 : the size of batch

**Return type** torch.Tensor

### 1.3.2 ProductOfNormal

```
class pixyz.distributions.ProductOfNormal (p=[], name='p', features_shape=torch.Size([J]))
```

Bases: pixyz.distributions.exponential\_distributions.Normal

Product of normal distributions.

$$p(z|x, y) \propto p(z)p(z|x)p(z|y)$$

In this model,  $p(z|x)$  and  $p(a|y)$  perform as *experts* and  $p(z)$  corresponds a prior of *experts*.

>>> pon.sample() # same as sampling from unit Gaussian. # doctest: +SKIP
{'z': tensor(-0.4494)}
```

`__init__(p=[], name='p', features_shape=torch.Size([]))`

#### Parameters

- `p` (list of `pixyz.distributions.Normal`) – List of experts.
- `name` (str, defaults to “p”) – Name of this distribution. This name is displayed in `prob_text` and `prob_factorized_text`.
- `features_shape` (torch.Size or list, defaults to `torch.Size()`) – Shape of dimensions (features) of this distribution.

#### Examples

```
>>> p_x = Normal(cond_var=['z'], loc='z', scale=torch.ones(1, 1))
>>> pon = ProductOfNormal([p_x])
>>> sample = pon.sample({'z': torch.zeros(1, 1)})
>>> sample # doctest: +SKIP
```

#### prob\_factorized\_text

Return a formula of the factorized probability distribution.

**Type** str

#### prob\_joint\_factorized\_and\_text

Return a formula of the factorized probability distribution.

**Type** str

`get_params(params_dict={}, **kwargs)`

`log_prob(sum_features=True, feature_dims=None)`

Return an instance of `pixyz.losses.LogProb`.

## Parameters

- **sum\_features** (bool, defaults to True) – Whether the output is summed across some axes (dimensions) which are specified by `feature_dims`.
- **feature\_dims** (list or NoneType, defaults to None) – Set axes to sum across the output.

**Returns** An instance of `pixyz.losses.LogProb`

**Return type** `pixyz.losses.LogProb`

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[ "x" ],
...               features_shape=[10], name="p1")
>>> sample_x = torch.randn(1, 10) # Psuedo data
>>> log_prob = p1.log_prob().eval({ "x": sample_x })
>>> print(log_prob) # doctest: +SKIP
tensor([-16.1153])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=[ "x" ], cond_var=[ "y" ],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> log_prob = p2.log_prob().eval({ "x": sample_x, "y": sample_y })
>>> print(log_prob) # doctest: +SKIP
tensor([-21.5251])
```

**prob** (`sum_features=True, feature_dims=None`)

Return an instance of `pixyz.losses.Prob`.

## Parameters

- **sum\_features** (bool, defaults to True) – Choose whether the output is summed across some axes (dimensions) which are specified by `feature_dims`.
- **feature\_dims** (list or NoneType, defaults to None) – Set dimensions to sum across the output. (Note: this parameter is not used for now.)

**Returns** An instance of `pixyz.losses.Prob`

**Return type** `pixyz.losses.Prob`

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[ "x" ],
...               features_shape=[10], name="p1")
>>> sample_x = torch.randn(1, 10) # Psuedo data
>>> prob = p1.prob().eval({ "x": sample_x })
>>> print(prob) # doctest: +SKIP
tensor([4.0933e-07])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=[ "x"], cond_var=[ "y"],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> prob = p2.prob().eval({ "x": sample_x, "y": sample_y})
>>> print(prob) # doctest: +SKIP
tensor([2.9628e-09])
```

**get\_log\_prob** (*x\_dict*, *sum\_features=True*, *feature\_dims=None*)

Giving variables, this method returns values of log-pdf.

#### Parameters

- **x\_dict** (*dict*) – Input variables.
- **sum\_features** (*bool*, defaults to True) – Whether the output is summed across some dimensions which are specified by *feature\_dims*.
- **feature\_dims** (*list* or *NoneType*, defaults to None) – Set dimensions to sum across the output.

**Returns** **log\_prob** – Values of log-probability density/mass function.

**Return type** `torch.Tensor`

#### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[ "x"],
...               features_shape=[10], name="p1")
>>> sample_x = torch.randn(1, 10) # Psuedo data
>>> log_prob = p1.log_prob({ "x": sample_x})
>>> print(log_prob) # doctest: +SKIP
tensor([-16.1153])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=[ "x"], cond_var=[ "y"],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> log_prob = p2.log_prob({ "x": sample_x, "y": sample_y})
>>> print(log_prob) # doctest: +SKIP
tensor([-21.5251])
```

### 1.3.3 ElementWiseProductOfNormal

```
class pixyz.distributions.ElementWiseProductOfNormal(p, name='p', features_shape=torch.Size([]))
```

Bases: `pixyz.distributions.poe.ProductOfNormal`

Product of normal distributions. In this distribution, each element of the input vector on the given distribution is considered as a different expert.

$$p(z|x) = p(z|x_1, x_2) \propto p(z)p(z|x_1)p(z|x_2)$$

## Examples

```
>>> pon = ElementWiseProductOfNormal(p) # doctest: +SKIP
>>> pon.sample({"x": x}) # doctest: +SKIP
{'x': tensor([[0., 0., 1., 0., 0., 0., 0., 0., 0.],

```

`__init__(p, name='p', features_shape=torch.Size([]))`

### Parameters

- **p** (`pixyz.distributions.Normal`) – Each element of this input vector is considered as a different expert. When some elements are 0, experts corresponding to these elements are considered not to be specified.  $p(z|x) = p(z|x_1, x_2 = 0) \propto p(z)p(z|x_1)$
- **name** (`str`, defaults to "p") – Name of this distribution. This name is displayed in `prob_text` and `prob_factorized_text`.
- **features\_shape** (`torch.Size` or `list`, defaults to `torch.Size()`) – Shape of dimensions (features) of this distribution.

## 1.4 Flow distributions

### 1.4.1 TransformedDistribution

```
class pixyz.distributions.TransformedDistribution(prior, flow, var, name='p')  
Bases: pixyz.distributions.distributions.Distribution
```

Convert flow transformations to distributions.

$$p(z = f_{flow}(x)),$$

where  $x \sim p_{prior}(x)$ .

Once initializing, it can be handled as a distribution module.

**distribution\_name**

Name of this distribution class.

**Type** str

**flow\_input\_var**

Input variables of the flow module.

**Type** list

**prob\_factorized\_text**

Return a formula of the factorized probability distribution.

**Type** str

**logdet\_jacobian**

Get log-determinant Jacobian.

Before calling this, you should run `forward` or `update_jacobian` methods to calculate and store log-determinant Jacobian.

```
sample(x_dict={}, batch_n=None, sample_shape=torch.Size([]), return_all=True, reparam=False,  
       compute_jacobian=True)
```

Sample variables of this distribution. If `cond_var` is not empty, you should set inputs as dict.

**Parameters**

- **x\_dict** (torch.Tensor, list, or dict, defaults to {}) – Input variables.
- **batch\_n** (int, defaults to None.) – Set batch size of parameters.
- **sample\_shape** (list or NoneType, defaults to torch.Size()) – Shape of generating samples.
- **return\_all** (bool, defaults to True) – Choose whether the output contains input variables.
- **reparam** (bool, defaults to False.) – Choose whether we sample variables with re-parameterized trick.

**Returns output** – Samples of this distribution.

**Return type** dict

## Examples

```
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p = Normal(loc=0, scale=1, var=["x"], features_shape=[10, 2])
>>> print(p)
Distribution:
p(x)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([10, 2])
    (loc): torch.Size([1, 10, 2])
    (scale): torch.Size([1, 10, 2])
)
>>> p.sample()["x"].shape # (batch_n=1, features_shape)
torch.Size([1, 10, 2])
>>> p.sample(batch_n=20)["x"].shape # (batch_n, features_shape)
torch.Size([20, 10, 2])
>>> p.sample(batch_n=20, sample_shape=[40, 30])["x"].shape # (sample_shape, ↴
batch_n, features_shape)
torch.Size([40, 30, 20, 10, 2])
```

```
>>> # Conditional distribution
>>> p = Normal(loc="y", scale=1., var=["x"], cond_var=["y"], features_
↪shape=[10])
>>> print(p)
Distribution:
p(x|y)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=['y'], input_var=['y'], features_shape=torch.
↪Size([10])
    (scale): torch.Size([1, 10])
)
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> sample_a = torch.randn(1, 10) # Psuedo data
>>> sample = p.sample({"y": sample_y})
>>> print(sample) # input_var + var # doctest: +SKIP
{'y': tensor([-0.5182,  0.3484,  0.9042,  0.1914,  0.6905,
             -1.0859, -0.4433, -0.0255,  0.8198,  0.4571])),
 'x': tensor([-0.7205, -1.3996,  0.5528, -0.3059,  0.5384,
             -1.4976, -0.1480,  0.0841,  0.3321,  0.5561]))}
>>> sample = p.sample({"y": sample_y, "a": sample_a}) # Redundant input ("a")
>>> print(sample) # input_var + var + "a" (redundant input) # doctest: +SKIP
{'y': tensor([1.3582, -1.1151, -0.8111,  1.0630,  1.1633,
             0.3855,  2.6324, -0.9357, -0.8649, -0.6015])),
 'a': tensor([-0.1874,  1.7958, -1.4084, -2.5646,  1.0868,
             -0.7523, -0.0852, -2.4222, -0.3914, -0.9755])),
 'x': tensor([-0.3272, -0.5222, -1.3659,  1.8386,  2.3204,
             0.3686,  0.6311, -1.1208,  0.3656, -0.6683]))}
```

**has\_reparam**

**get\_log\_prob** (*x\_dict*, *sum\_features=True*, *feature\_dims=None*, *compute\_jacobian=False*)

It calculates the log-likelihood for a given z. If a flow module has no inverse method, it only supports the previously sampled z-values.

**forward** ( $x, y=None, compute_jacobian=True$ )

Forward propagation of flow layers.

#### Parameters

- **x** (`torch.Tensor`) – Input data.
- **y** (`torch.Tensor, defaults to None`) – Data for conditioning.
- **compute\_jacobian** (`bool, defaults to True`) – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in `logdet_jacobian`.

#### Returns z

**Return type** `torch.Tensor`

**inverse** ( $z, y=None$ )

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

#### Parameters

- **z** (`torch.Tensor`) – Input data.
- **y** (`torch.Tensor, defaults to None`) – Data for conditioning.

#### Returns x

**Return type** `torch.Tensor`

## 1.4.2 InverseTransformedDistribution

```
class pixyz.distributions.InverseTransformedDistribution(prior,      flow,      var,
                                                       cond_var=[],      name='p')
```

Bases: `pixyz.distributions.distributions.Distribution`

Convert inverse flow transformations to distributions.

$$p(x = f_{flow}^{-1}(z)),$$

where  $z \sim p_{prior}(z)$ .

Once initializing, it can be handled as a distribution module.

Moreover, this distribution can take a conditional variable.

$$p(x = f_{flow}^{-1}(z, y)),$$

where  $z \sim p_{prior}(z)$  and  $y$  is given.

**distribution\_name**

Name of this distribution class.

**Type** str

**flow\_output\_var**

**prob\_factorized\_text**

Return a formula of the factorized probability distribution.

**Type** str

**logdet\_jacobian**

Get log-determinant Jacobian.

Before calling this, you should run `forward` or `update_jacobian` methods to calculate and store log-determinant Jacobian.

**sample** (`x_dict={}`, `batch_n=None`, `sample_shape=torch.Size([])`, `return_all=True`, `reparam=False`, `return_hidden=True`)  
Sample variables of this distribution. If `cond_var` is not empty, you should set inputs as dict.

**Parameters**

- **x\_dict** (torch.Tensor, list, or dict, defaults to {}) – Input variables.
- **batch\_n** (int, defaults to None.) – Set batch size of parameters.
- **sample\_shape** (list or NoneType, defaults to torch.Size()) – Shape of generating samples.
- **return\_all** (bool, defaults to True) – Choose whether the output contains input variables.
- **reparam** (bool, defaults to False.) – Choose whether we sample variables with re-parameterized trick.

**Returns** `output` – Samples of this distribution.

**Return type** dict

**Examples**

```
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p = Normal(loc=0, scale=1, var=["x"], features_shape=[10, 2])
>>> print(p)
Distribution:
p(x)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([10, 2])
    (loc): torch.Size([1, 10, 2])
    (scale): torch.Size([1, 10, 2])
)
>>> p.sample()["x"].shape # (batch_n=1, features_shape)
torch.Size([1, 10, 2])
>>> p.sample(batch_n=20)["x"].shape # (batch_n, features_shape)
torch.Size([20, 10, 2])
>>> p.sample(batch_n=20, sample_shape=[40, 30])["x"].shape # (sample_shape, ↴batch_n, features_shape)
torch.Size([40, 30, 20, 10, 2])
```

```
>>> # Conditional distribution
>>> p = Normal(loc="y", scale=1., var=["x"], cond_var=["y"], features_
    ↴shape=[10])
>>> print(p)
Distribution:
p(x|y)
Network architecture:
```

(continues on next page)

(continued from previous page)

```

Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=['y'], input_var=['y'], features_shape=torch.
    →Size([10])
    (scale): torch.Size([1, 10])
)
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> sample_a = torch.randn(1, 10) # Psuedo data
>>> sample = p.sample({"y": sample_y})
>>> print(sample) # input_var + var # doctest: +SKIP
{'y': tensor([-0.5182,  0.3484,  0.9042,  0.1914,  0.6905,
             -1.0859, -0.4433, -0.0255,  0.8198,  0.4571])),
 'x': tensor([-0.7205, -1.3996,  0.5528, -0.3059,  0.5384,
             -1.4976, -0.1480,  0.0841,  0.3321,  0.5561]))}
>>> sample = p.sample({"y": sample_y, "a": sample_a}) # Redundant input ("a")

 'a': tensor([-0.1874,  1.7958, -1.4084, -2.5646,  1.0868,
              -0.7523, -0.0852, -2.4222, -0.3914, -0.9755])),
 'x': tensor([-0.3272, -0.5222, -1.3659,  1.8386,  2.3204,
              0.3686,  0.6311, -1.1208,  0.3656, -0.6683]))}

```

**has\_reparam****inference** (*x\_dict*, *return\_all=True*, *compute\_jacobian=False*)**get\_log\_prob** (*x\_dict*, *sum\_features=True*, *feature\_dims=None*)

Giving variables, this method returns values of log-pdf.

**Parameters**

- **x\_dict** (*dict*) – Input variables.
- **sum\_features** (*bool*, defaults to True) – Whether the output is summed across some dimensions which are specified by *feature\_dims*.
- **feature\_dims** (*list* or *NoneType*, defaults to None) – Set dimensions to sum across the output.

**Returns** **log\_prob** – Values of log-probability density/mass function.**Return type** `torch.Tensor`**Examples**

```

>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...                 features_shape=[10], name="p1")
>>> sample_x = torch.randn(1, 10) # Psuedo data
>>> log_prob = p1.log_prob({"x": sample_x})
>>> print(log_prob) # doctest: +SKIP
tensor([-16.1153])

```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> log_prob = p2.log_prob({"x": sample_x, "y": sample_y})
>>> print(log_prob) # doctest: +SKIP
tensor([-21.5251])
```

**forward**(*x*, *y*=None, *compute\_jacobian*=True)

Forward propagation of flow layers.

#### Parameters

- **x**(*torch.Tensor*) – Input data.
- **y**(*torch.Tensor*, *defaults to None*) – Data for conditioning.
- **compute\_jacobian**(*bool*, *defaults to True*) – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in *logdet\_jacobian*.

#### Returns z

**Return type** *torch.Tensor*

**inverse**(*z*, *y*=None)

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

#### Parameters

- **z**(*torch.Tensor*) – Input data.
- **y**(*torch.Tensor*, *defaults to None*) – Data for conditioning.

#### Returns x

**Return type** *torch.Tensor*

## 1.5 Special distributions

### 1.5.1 Deterministic

**class** *pixyz.distributions.Deterministic*(*var*, *cond\_var*=[], *name*='p', *\*\*kwargs*)

Bases: *pixyz.distributions.distributions.Distribution*

Deterministic distribution (or degeneration distribution)

#### Examples

```
>>> import torch
>>> class Generator(Deterministic):
...     def __init__(self):
...         super().__init__(var=["x"], cond_var=["z"])
...         self.model = torch.nn.Linear(64, 512)
...     def forward(self, z):
...         return {"x": self.model(z)}
>>> p = Generator()
```

(continues on next page)

(continued from previous page)

```
>>> print(p)
Distribution:
p(x|z)
Network architecture:
Generator(
    name=p, distribution_name=Deterministic,
    var=['x'], cond_var=['z'], input_var=['z'], features_shape=torch.Size([])
    (model): Linear(in_features=64, out_features=512, bias=True)
)
>>> sample = p.sample({"z": torch.randn(1, 64)})
>>> p.log_prob().eval(sample) # log_prob is not defined.
Traceback (most recent call last):
...
NotImplementedError: Log probability of deterministic distribution is not defined.
```

**distribution\_name**

Name of this distribution class.

**Type** str**sample**(*x\_dict*={}, *return\_all*=True, \*\**kwargs*)Sample variables of this distribution. If *cond\_var* is not empty, you should set inputs as *dict*.**Parameters**

- **x\_dict** (torch.Tensor, list, or dict, defaults to {}) – Input variables.
- **batch\_n** (int, defaults to None.) – Set batch size of parameters.
- **sample\_shape** (list or NoneType, defaults to torch.Size()) – Shape of generating samples.
- **return\_all** (bool, defaults to True) – Choose whether the output contains input variables.
- **reparam** (bool, defaults to False.) – Choose whether we sample variables with re-parameterized trick.

**Returns** **output** – Samples of this distribution.**Return type** dict**Examples**

```
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p = Normal(loc=0, scale=1, var=["x"], features_shape=[10, 2])
>>> print(p)
Distribution:
p(x)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([10, 2])
    (loc): torch.Size([1, 10, 2])
    (scale): torch.Size([1, 10, 2])
)
>>> p.sample()["x"].shape # (batch_n=1, features_shape)
```

(continues on next page)

(continued from previous page)

```

torch.Size([1, 10, 2])
>>> p.sample(batch_n=20)["x"].shape # (batch_n, features_shape)
torch.Size([20, 10, 2])
>>> p.sample(batch_n=20, sample_shape=[40, 30])["x"].shape # (sample_shape, -->
    <--batch_n, features_shape)
torch.Size([40, 30, 20, 10, 2])

```

```

>>> # Conditional distribution
>>> p = Normal(loc="y", scale=1., var=["x"], cond_var=["y"], features_ -->
    <--shape=[10])
>>> print(p)
Distribution:
p(x|y)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=['y'], input_var=['y'], features_shape=torch. -->
    <--Size([10])

```

**sample\_mean (x\_dict)**

Return the mean of the distribution.

**Parameters** **x\_dict** (dict, defaults to {}) – Parameters of this distribution.**Examples**

```

>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...                 features_shape=[10], name="p1")
>>> mean = p1.sample_mean()
>>> print(mean)
tensor([0., 0., 0., 0., 0., 0., 0., 0., 0., 0.])

```

```

>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],

```

(continues on next page)

(continued from previous page)

```

...
    features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> mean = p2.sample_mean({"y": sample_y})
>>> print(mean) # doctest: +SKIP
tensor([-0.2189, -1.0310, -0.1917, -0.3085,  1.5190, -0.9037,  1.2559,  0.
       -1410,
       1.2810, -0.6681])

```

**get\_log\_prob** (*x\_dict*, *sum\_features=True*, *feature\_dims=None*)

Giving variables, this method returns values of log-pdf.

**Parameters**

- **x\_dict** (*dict*) – Input variables.
- **sum\_features** (*bool*, defaults to True) – Whether the output is summed across some dimensions which are specified by *feature\_dims*.
- **feature\_dims** (*list* or *NoneType*, defaults to None) – Set dimensions to sum across the output.

**Returns** **log\_prob** – Values of log-probability density/mass function.**Return type** torch.Tensor**Examples**

```

>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...               features_shape=[10], name="p1")
>>> sample_x = torch.randn(1, 10) # Psuedo data
>>> log_prob = p1.log_prob({"x": sample_x})
>>> print(log_prob) # doctest: +SKIP
tensor([-16.1153])

```

```

>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> log_prob = p2.log_prob({"x": sample_x, "y": sample_y})
>>> print(log_prob) # doctest: +SKIP
tensor([-21.5251])

```

**has\_reparam****1.5.2 EmpiricalDistribution**

```
class pixyz.distributions.EmpiricalDistribution(var, name='p_{data}')
Bases: pixyz.distributions.distributions.Distribution
```

Data distribution.

Samples from this distribution equal given inputs.

## Examples

```
>>> import torch
>>> p = EmpiricalDistribution(var=["x"])
>>> print(p)
Distribution:
p_{data}(x)
Network architecture:
EmpiricalDistribution(
    name=p_{data}, distribution_name=Data distribution,
    var=['x'], cond_var=[], input_var=['x'], features_shape=torch.Size([])
)
>>> sample = p.sample({"x": torch.randn(1, 64)})
```

### **distribution\_name**

Name of this distribution class.

#### **Type** str

### **sample** (*x\_dict*={}, *return\_all*=True, \*\**kwargs*)

Sample variables of this distribution. If *cond\_var* is not empty, you should set inputs as *dict*.

#### **Parameters**

- **x\_dict** (torch.Tensor, list, or dict, defaults to {}) – Input variables.
- **batch\_n** (int, defaults to None.) – Set batch size of parameters.
- **sample\_shape** (list or NoneType, defaults to torch.Size()) – Shape of generating samples.
- **return\_all** (bool, defaults to True) – Choose whether the output contains input variables.
- **reparam** (bool, defaults to False.) – Choose whether we sample variables with re-parameterized trick.

**Returns** **output** – Samples of this distribution.

**Return type** dict

## Examples

```
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p = Normal(loc=0, scale=1, var=["x"], features_shape=[10, 2])
>>> print(p)
Distribution:
p(x)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=[], input_var=[], features_shape=torch.Size([10, 2])
    (loc): torch.Size([1, 10, 2])
    (scale): torch.Size([1, 10, 2])
)
>>> p.sample()["x"].shape # (batch_n=1, features_shape)
torch.Size([1, 10, 2])
>>> p.sample(batch_n=20)["x"].shape # (batch_n, features_shape)
```

(continues on next page)

(continued from previous page)

```
torch.Size([20, 10, 2])

 'x': tensor([-0.3272, -0.5222, -1.3659,  1.8386,  2.3204,
              0.3686,  0.6311, -1.1208,  0.3656, -0.6683])}
```

### sample\_mean(x\_dict)

Return the mean of the distribution.

**Parameters** **x\_dict** (dict, defaults to {}) – Parameters of this distribution.

### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...                 features_shape=[10], name="p1")
>>> mean = p1.sample_mean()
>>> print(mean)
tensor([0., 0., 0., 0., 0., 0., 0., 0., 0., 0.])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...                 features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
```

(continues on next page)

(continued from previous page)

```
>>> mean = p2.sample_mean({"y": sample_y})
>>> print(mean) # doctest: +SKIP
tensor([-0.2189, -1.0310, -0.1917, -0.3085,  1.5190, -0.9037,  1.2559,  0.
       -1410,
       1.2810, -0.6681])
```

**get\_log\_prob** (*x\_dict*, *sum\_features=True*, *feature\_dims=None*)  
 Giving variables, this method returns values of log-pdf.

#### Parameters

- **x\_dict** (*dict*) – Input variables.
- **sum\_features** (*bool*, defaults to True) – Whether the output is summed across some dimensions which are specified by *feature\_dims*.
- **feature\_dims** (*list* or *NoneType*, defaults to None) – Set dimensions to sum across the output.

**Returns** **log\_prob** – Values of log-probability density/mass function.

**Return type** torch.Tensor

#### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...               features_shape=[10], name="p1")
>>> sample_x = torch.randn(1, 10) # Psuedo data
>>> log_prob = p1.log_prob({"x": sample_x})
>>> print(log_prob) # doctest: +SKIP
tensor([-16.1153])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> log_prob = p2.log_prob({"x": sample_x, "y": sample_y})
>>> print(log_prob) # doctest: +SKIP
tensor([-21.5251])
```

#### input\_var

In EmpiricalDistribution, *input\_var* is same as *var*.

#### has\_reparam

### 1.5.3 CustomProb

```
class pixyz.distributions.CustomProb(log_prob_function, var, distribution_name='Custom
PDF', **kwargs)
Bases: pixyz.distributions.distributions.Distribution
```

This distribution is constructed by user-defined probability density/mass function.

Note that this distribution cannot perform sampling.

## Examples

```
>>> import torch
>>> # banana shaped distribution
>>> def log_prob(z):
...     z1, z2 = torch.chunk(z, chunks=2, dim=1)
...     norm = torch.sqrt(z1 ** 2 + z2 ** 2)
...     exp1 = torch.exp(-0.5 * ((z1 - 2) / 0.6) ** 2)
...     exp2 = torch.exp(-0.5 * ((z1 + 2) / 0.6) ** 2)
...     u = 0.5 * ((norm - 2) / 0.4) ** 2 - torch.log(exp1 + exp2)
...     return -u
...
>>> p = CustomProb(log_prob, var=["z"])
>>> loss = p.log_prob().eval({"z": torch.randn(10, 2)})
```

`__init__(log_prob_function, var, distribution_name='Custom PDF', **kwargs)`

### Parameters

- **log\_prob\_function** (*function*) – User-defined log-probability density/mass function.
- **var** (*list*) – Variables of this distribution.
- **distribution\_name** (*str*, optional) – Name of this distribution.
- **\*\*kwargs** – Arbitrary keyword arguments.

#### `log_prob_function`

User-defined log-probability density/mass function.

#### `input_var`

Input variables of this distribution. Normally, it has same values as `cond_var`.

**Type** list

#### `distribution_name`

Name of this distribution class.

**Type** str

#### `get_log_prob(x_dict, sum_features=True, feature_dims=None)`

Giving variables, this method returns values of log-pdf.

### Parameters

- **x\_dict** (*dict*) – Input variables.
- **sum\_features** (*bool*, defaults to True) – Whether the output is summed across some dimensions which are specified by `feature_dims`.
- **feature\_dims** (*list* or *NoneType*, defaults to None) – Set dimensions to sum across the output.

**Returns** `log_prob` – Values of log-probability density/mass function.

**Return type** torch.Tensor

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[ "x" ],
...               features_shape=[10], name="p1")
>>> sample_x = torch.randn(1, 10) # Psuedo data
>>> log_prob = p1.log_prob({ "x": sample_x })
>>> print(log_prob) # doctest: +SKIP
tensor([-16.1153])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=[ "x" ], cond_var=[ "y" ],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> log_prob = p2.log_prob({ "x": sample_x, "y": sample_y })
>>> print(log_prob) # doctest: +SKIP
tensor([-21.5251])
```

**sample**(*x\_dict*={}, *return\_all*=True, \*\**kwargs*)

Sample variables of this distribution. If *cond\_var* is not empty, you should set inputs as dict.

**Parameters**

- **x\_dict** (torch.Tensor, list, or dict, defaults to {}) – Input variables.
- **batch\_n** (int, defaults to None.) – Set batch size of parameters.
- **sample\_shape** (list or NoneType, defaults to torch.Size()) – Shape of generating samples.
- **return\_all** (bool, defaults to True) – Choose whether the output contains input variables.
- **reparam** (bool, defaults to False.) – Choose whether we sample variables with re-parameterized trick.

**Returns** **output** – Samples of this distribution.

**Return type** dict

**Examples**

```
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p = Normal(loc=0, scale=1, var=[ "x" ], features_shape=[10, 2])
>>> print(p)
Distribution:
p(x)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=[ 'x' ], cond_var=[], input_var=[], features_shape=torch.Size([10, 2])
    (loc): torch.Size([1, 10, 2])
    (scale): torch.Size([1, 10, 2])
)
>>> p.sample()["x"].shape # (batch_n=1, features_shape)
torch.Size([1, 10, 2])
>>> p.sample(batch_n=20)["x"].shape # (batch_n, features_shape)
```

(continues on next page)

(continued from previous page)

```
torch.Size([20, 10, 2])
>>> p.sample(batch_n=20, sample_shape=[40, 30])["x"].shape # (sample_shape, ↵
batch_n, features_shape)
torch.Size([40, 30, 20, 10, 2])
```

```
>>> # Conditional distribution
>>> p = Normal(loc="y", scale=1., var=["x"], cond_var=["y"], features_
shape=[10])
>>> print(p)
Distribution:
p(x|y)
Network architecture:
Normal(
    name=p, distribution_name=Normal,
    var=['x'], cond_var=['y'], input_var=['y'], features_shape=torch.
Size([10])
    (scale): torch.Size([1, 10])
)
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> sample_a = torch.randn(1, 10) # Psuedo data
>>> sample = p.sample({"y": sample_y})
>>> print(sample) # input_var + var # doctest: +SKIP
{'y': tensor([-0.5182,  0.3484,  0.9042,  0.1914,  0.6905,
             -1.0859, -0.4433, -0.0255,  0.8198,  0.4571]),
 'x': tensor([-0.7205, -1.3996,  0.5528, -0.3059,  0.5384,
             -1.4976, -0.1480,  0.0841,  0.3321,  0.5561])}
>>> sample = p.sample({"y": sample_y, "a": sample_a}) # Redundant input ("a")
>>> print(sample) # input_var + var + "a" (redundant input) # doctest: +SKIP
{'y': tensor([ 1.3582, -1.1151, -0.8111,  1.0630,  1.1633,
              0.3855,  2.6324, -0.9357, -0.8649, -0.6015]),

             -0.7523, -0.0852, -2.4222, -0.3914, -0.9755]),
 'x': tensor([-0.3272, -0.5222, -1.3659,  1.8386,  2.3204,
              0.3686,  0.6311, -1.1208,  0.3656, -0.6683])}
```

**has\_reparam**

## 1.6 Operators

### 1.6.1 ReplaceVarDistribution

**class** pixyz.distributions.ReplaceVarDistribution(*p, replace\_dict*)  
Bases: *pixyz.distributions.distributions.Distribution*

Replace names of variables in Distribution.

#### Examples

```
>>> p = DistributionBase(var=["x"], cond_var=["z"])
>>> print(p)
Distribution:
p(x|z)
```

(continues on next page)

(continued from previous page)

```

Network architecture:
DistributionBase(
    name=p, distribution_name=,
    var=['x'], cond_var=['z'], input_var=['z'], features_shape=torch.Size([]))
)
>>> replace_dict = {'x': 'y'}
>>> p_repl = ReplaceVarDistribution(p, replace_dict)
>>> print(p_repl)
Distribution:
p(y|z)
Network architecture:
p(y|z) -> p(x|z):
DistributionBase(
    name=p, distribution_name=,
    var=['x'], cond_var=['z'], input_var=['z'], features_shape=torch.Size([]))
)

```

**`__init__(p, replace_dict)`**

#### Parameters

- **p** (`pixyz.distributions.Distribution` (not `pixyz.distributions.MultiplyDistribution`)) – Distribution.
- **replace\_dict** (`dict`) – Dictionary.

**`forward(*args, **kwargs)`**

When this class is inherited by DNNs, this method should be overridden.

**`sample_mean(x_dict={})`**

Return the mean of the distribution.

**Parameters** **x\_dict** (`dict`, defaults to `{}`) – Parameters of this distribution.

#### Examples

```

>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...               features_shape=[10], name="p1")
>>> mean = p1.sample_mean()
>>> print(mean)
tensor([0., 0., 0., 0., 0., 0., 0., 0., 0., 0.])

```

```

>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> mean = p2.sample_mean({"y": sample_y})
>>> print(mean) # doctest: +SKIP
tensor([-0.2189, -1.0310, -0.1917, -0.3085,  1.5190, -0.9037,  1.2559,  0.
       1410,
       1.2810, -0.6681])

```

**`sample_variance(x_dict={})`**

Return the variance of the distribution.

**Parameters** `x_dict` (dict, defaults to {}) – Parameters of this distribution.

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[ "x" ],
...               features_shape=[10], name="p1")
>>> var = p1.sample_variance()
>>> print(var)
tensor([[1., 1., 1., 1., 1., 1., 1., 1., 1., 1.]])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=[ "x" ], cond_var=[ "y" ],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> var = p2.sample_variance({ "y": sample_y })
>>> print(var) # doctest: +SKIP
tensor([[1., 1., 1., 1., 1., 1., 1., 1., 1., 1.]])
```

**get\_entropy** (`x_dict={}`, `sum_features=True`, `feature_dims=None`)

Giving variables, this method returns values of entropy.

### Parameters

- `x_dict` (dict, defaults to {}) – Input variables.
- `sum_features` (bool, defaults to True) – Whether the output is summed across some dimensions which are specified by `feature_dims`.
- `feature_dims` (list or NoneType, defaults to None) – Set dimensions to sum across the output.

**Returns** `entropy` – Values of entropy.

**Return type** torch.Tensor

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[ "x" ],
...               features_shape=[10], name="p1")
>>> entropy = p1.get_entropy()
>>> print(entropy)
tensor([14.1894])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=[ "x" ], cond_var=[ "y" ],
...               features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> entropy = p2.get_entropy({ "y": sample_y })
>>> print(entropy)
tensor([14.1894])
```

**distribution\_name**

Name of this distribution class.

**Type** str

## 1.6.2 MarginalizeVarDistribution

```
class pixyz.distributions.MarginalizeVarDistribution(p:
                                                       pixyz.distributions.distributions.Distribution,
                                                       marginalize_list)
Bases: pixyz.distributions.distributions.Distribution
```

Marginalize variables in Distribution.

$$p(x) = \int p(x, z) dz$$

### Examples

```
>>> a = DistributionBase(var=["x"], cond_var=["z"])
>>> b = DistributionBase(var=["y"], cond_var=["z"])
>>> p_multi = a * b
>>> print(p_multi)
Distribution:
p(x,y|z) = p(x|z)p(y|z)
Network architecture:
p(y|z):
DistributionBase(
    name=p, distribution_name=,
    var=['y'], cond_var=['z'], input_var=['z'], features_shape=torch.Size([]))
)
p(x|z):
DistributionBase(
    name=p, distribution_name=,
    var=['x'], cond_var=['z'], input_var=['z'], features_shape=torch.Size([]))
)
>>> p_marg = MarginalizeVarDistribution(p_multi, ["y"])
>>> print(p_marg)
Distribution:
p(x|z) = \int p(x|z)p(y|z) dy
Network architecture:
p(y|z):
DistributionBase(
    name=p, distribution_name=,
    var=['y'], cond_var=['z'], input_var=['z'], features_shape=torch.Size([]))
)
p(x|z):
DistributionBase(
    name=p, distribution_name=,
    var=['x'], cond_var=['z'], input_var=['z'], features_shape=torch.Size([]))
)
```

**\_\_init\_\_**(*p*: *pixyz.distributions.distributions.Distribution*, *marginalize\_list*)

#### Parameters

- **p** (*pixyz.distributions.Distribution* (not *pixyz.distributions.DistributionBase*)) – Distribution.

- **marginalize\_list**(*list*) – Variables to marginalize.

```
forward(*args, **kwargs)
```

When this class is inherited by DNNs, this method should be overridden.

```
sample_mean(x_dict={})
```

Return the mean of the distribution.

**Parameters** **x\_dict** (dict, defaults to {}) – Parameters of this distribution.

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...                 features_shape=[10], name="p1")
>>> mean = p1.sample_mean()
>>> print(mean)
tensor([[0., 0., 0., 0., 0., 0., 0., 0., 0., 0.]])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...                 features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> mean = p2.sample_mean({"y": sample_y})
>>> print(mean) # doctest: +SKIP
tensor([-0.2189, -1.0310, -0.1917, -0.3085,  1.5190, -0.9037,  1.2559,  0.
       -1410,
       1.2810, -0.6681]))
```

```
sample_variance(x_dict={})
```

Return the variance of the distribution.

**Parameters** **x\_dict** (dict, defaults to {}) – Parameters of this distribution.

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...                 features_shape=[10], name="p1")
>>> var = p1.sample_variance()
>>> print(var)
tensor([[1., 1., 1., 1., 1., 1., 1., 1., 1., 1.]])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=["x"], cond_var=["y"],
...                 features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> var = p2.sample_variance({"y": sample_y})
>>> print(var) # doctest: +SKIP
tensor([[1., 1., 1., 1., 1., 1., 1., 1., 1., 1.]])
```

**get\_entropy** (*x\_dict*={}, *sum\_features*=True, *feature\_dims*=None)  
 Giving variables, this method returns values of entropy.

#### Parameters

- **x\_dict** (dict, defaults to {}) – Input variables.
- **sum\_features** (bool, defaults to True) – Whether the output is summed across some dimensions which are specified by *feature\_dims*.
- **feature\_dims** (list or NoneType, defaults to None) – Set dimensions to sum across the output.

**Returns** **entropy** – Values of entropy.

**Return type** torch.Tensor

#### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> # Marginal distribution
>>> p1 = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[ "x" ],
...                 features_shape=[10], name="p1")
>>> entropy = p1.get_entropy()
>>> print(entropy)
tensor([14.1894])
```

```
>>> # Conditional distribution
>>> p2 = Normal(loc="y", scale=torch.tensor(1.), var=[ "x" ], cond_var=[ "y" ],
...                 features_shape=[10], name="p2")
>>> sample_y = torch.randn(1, 10) # Psuedo data
>>> entropy = p2.get_entropy({ "y": sample_y })
>>> print(entropy)
tensor([14.1894])
```

#### distribution\_name

Name of this distribution class.

**Type** str

### 1.6.3 MultiplyDistribution

**class** pixyz.distributions.**MultiplyDistribution**(*a, b*)  
 Bases: pixyz.distributions.distributions.Distribution

Multiply by given distributions, e.g,  $p(x, y|z) = p(x|z, y)p(y|z)$ . In this class, it is checked if two distributions can be multiplied.

p(x|z)p(z|y) -> Valid  
 p(x|z)p(y|z) -> Valid  
 p(x|z)p(y|a) -> Valid  
 p(x|z)p(z|x) -> Invalid (recursive)  
 p(x|z)p(x|y) -> Invalid (conflict)

## Examples

```

>>> a = DistributionBase(var=["x"], cond_var=["z"])
>>> b = DistributionBase(var=["z"], cond_var=["y"])
>>> p_multi = MultiplyDistribution(a, b)
>>> print(p_multi)
Distribution:
p(x,z|y) = p(x|z)p(z|y)
Network architecture:
p(z|y):
DistributionBase(
    name=p, distribution_name=,
    var=['z'], cond_var=['y'], input_var=['y'], features_shape=torch.Size([]))
)
p(x|z):
DistributionBase(
    name=p, distribution_name=,
    var=['x'], cond_var=['z'], input_var=['z'], features_shape=torch.Size([]))
)
>>> b = DistributionBase(var=["y"], cond_var=["z"])
>>> p_multi = MultiplyDistribution(a, b)
>>> print(p_multi)
Distribution:
p(x,y|z) = p(x|z)p(y|z)
Network architecture:
p(y|z):
DistributionBase(
    name=p, distribution_name=,
    var=['y'], cond_var=['z'], input_var=['z'], features_shape=torch.Size([]))
)
p(x|z):
DistributionBase(
    name=p, distribution_name=,
    var=['x'], cond_var=['z'], input_var=['z'], features_shape=torch.Size([]))
)
>>> b = DistributionBase(var=["y"], cond_var=["a"])
>>> p_multi = MultiplyDistribution(a, b)
>>> print(p_multi)
Distribution:
p(x,y|z,a) = p(x|z)p(y|a)
Network architecture:
p(y|a):
DistributionBase(
    name=p, distribution_name=,
    var=['y'], cond_var=['a'], input_var=['a'], features_shape=torch.Size([]))
)
p(x|z):
DistributionBase(
    name=p, distribution_name=,
    var=['x'], cond_var=['z'], input_var=['z'], features_shape=torch.Size([]))
)

```

`__init__(a, b)`

### Parameters

- **a** (*pixyz.Distribution*) – Distribution.
- **b** (*pixyz.Distribution*) – Distribution.

# CHAPTER 2

## pixyz.losses (Loss API)

### 2.1 Loss

```
class pixyz.losses.losses.Loss(input_var=None)
```

Bases: torch.nn.modules.module.Module

Loss class. In Pixyz, all loss classes are required to inherit this class.

#### Examples

```
>>> import torch
>>> from torch.nn import functional as F
>>> from pixyz.distributions import Bernoulli, Normal
>>> from pixyz.losses import KullbackLeibler
...
>>> # Set distributions
>>> class Inference(Normal):
...     def __init__(self):
...         super().__init__(var=["z"], cond_var=["x"], name="q")
...         self.model_loc = torch.nn.Linear(128, 64)
...         self.model_scale = torch.nn.Linear(128, 64)
...     def forward(self, x):
...         return {"loc": self.model_loc(x), "scale": F.softplus(self.model_
...         scale(x))}
...
>>> class Generator(Bernoulli):
...     def __init__(self):
...         super().__init__(var=["x"], cond_var=["z"], name="p")
...         self.model = torch.nn.Linear(64, 128)
...     def forward(self, z):
...         return {"probs": torch.sigmoid(self.model(z))}
...
>>> p = Generator()
```

(continues on next page)

(continued from previous page)

```
>>> q = Inference()
>>> prior = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.),
...                   var=["z"], features_shape=[64], name="p_{prior}")
...
>>> # Define a loss function (VAE)
>>> reconst = -p.log_prob().expectation(q)
>>> kl = KullbackLeibler(q,prior)
>>> loss_cls = (reconst - kl).mean()
>>> print(loss_cls)
mean \left(- D_{KL} \left[ q(z|x) || p_{prior}(z) \right] - \mathbb{E}_{q(z|x)} \left[ \log p(x|z) \right] \right)
>>> # Evaluate this loss function
>>> data = torch.randn(1, 128) # Pseudo data
>>> loss = loss_cls.eval({"x": data})
>>> print(loss) # doctest: +SKIP
tensor(65.5939, grad_fn=<MeanBackward0>)
```

**`__init__(input_var=None)`**

**Parameters** `input_var` (list of str, defaults to None) – Input variables of this loss function. In general, users do not need to set them explicitly because these depend on the given distributions and each loss function.

**`input_var`**

Input variables of this distribution.

**Type** list

**`loss_text`****`abs()`**

Return an instance of `pixyz.losses.losses.AbsLoss`.

**Returns** An instance of `pixyz.losses.losses.AbsLoss`

**Return type** `pixyz.losses.losses.AbsLoss`

**`mean()`**

Return an instance of `pixyz.losses.losses.BatchMean`.

**Returns** An instance of `pixyz.losses.losses.BatchMean`

**Return type** `pixyz.losses.losses.BatchMean`

**`sum()`**

Return an instance of `pixyz.losses.losses.BatchSum`.

**Returns** An instance of `pixyz.losses.losses.BatchSum`

**Return type** `pixyz.losses.losses.BatchSum`

**`detach()`**

Return an instance of `pixyz.losses.losses.Detach`.

**Returns** An instance of `pixyz.losses.losses.Detach`

**Return type** `pixyz.losses.losses.Detach`

**`expectation(p, sample_shape=torch.Size([]))`**

Return an instance of `pixyz.losses.Expectation`.

**Parameters**

- **p** (*pixyz.distributions.Distribution*) – Distribution for sampling.
- **sample\_shape** (list or `NoneType`, defaults to `torch.Size()`) – Shape of generating samples.

**Returns** An instance of `pixyz.losses.Expectation`

**Return type** `pixyz.losses.Expectation`

**constant\_var** (*constant\_dict*)

Return an instance of `pixyz.losses.ConstantVar`.

**Parameters** `constant_dict` (*dict*) – constant variables.

**Returns** An instance of `pixyz.losses.ConstantVar`

**Return type** `pixyz.losses.ConstantVar`

**eval** (*x\_dict={}*, *return\_dict=False*, *return\_all=True*, *\*\*kwargs*)

Evaluate the value of the loss function given inputs (*x\_dict*).

**Parameters**

- **x\_dict** (*dict*, defaults to `{}`) – Input variables.
- **return\_dict** (*bool*, *default to False*.) – Whether to return samples along with the evaluated value of the loss function.
- **return\_all** (*bool*, *default to True*.) – Whether to return all samples, including those that have not been updated.

**Returns**

- **loss** (`torch.Tensor`) – the evaluated value of the loss function.
- **x\_dict** (*dict*) – All samples generated when evaluating the loss function. If `return_dict` is `False`, it is not returned.

**forward** (*x\_dict*, *\*\*kwargs*)

**Parameters** `x_dict` (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calcuated loss and updated all samples.*

## 2.2 Probability density function

### 2.2.1 LogProb

**class** `pixyz.losses.LogProb` (*p*, *sum\_features=True*, *feature\_dims=None*)  
Bases: `pixyz.losses.losses.Loss`

The log probability density/mass function.

$$\log p(x)$$

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> p = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[ "x" ],
...               features_shape=[10])
>>> loss_cls = LogProb(p) # or p.log_prob()
>>> print(loss_cls)
\log p(x)
>>> sample_x = torch.randn(2, 10) # Psuedo data
>>> loss = loss_cls.eval({ "x": sample_x})
>>> print(loss) # doctest: +SKIP
tensor([12.9894, 15.5280])
```

**forward**(*x=*{}, \*\**kwargs*)

**Parameters** **x\_dict**(*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calcuated loss and updated all samples.*

## 2.2.2 Prob

```
class pixyz.losses.Prob(p, sum_features=True, feature_dims=None)
Bases: pixyz.losses.pdf.LogProb
```

The probability density/mass function.

$$p(x) = \exp(\log p(x))$$

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> p = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[ "x" ],
...               features_shape=[10])
>>> loss_cls = Prob(p) # or p.prob()
>>> print(loss_cls)
p(x)
>>> sample_x = torch.randn(2, 10) # Psuedo data
>>> loss = loss_cls.eval({ "x": sample_x})
>>> print(loss) # doctest: +SKIP
tensor([3.2903e-07, 5.5530e-07])
```

**forward**(*x=*{}, \*\**kwargs*)

**Parameters** **x\_dict**(*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calcuated loss and updated all samples.*

## 2.3 Expected value

### 2.3.1 Expectation

```
class pixyz.losses.Expectation(p,f,sample_shape=torch.Size([1]), reparam=True)
Bases: pixyz.losses.losses.Loss
```

Expectation of a given function (Monte Carlo approximation).

$$\mathbb{E}_{p(x)}[f(x)] \approx \frac{1}{L} \sum_{l=1}^L f(x_l), \quad \text{where } x_l \sim p(x).$$

Note that  $f$  doesn't need to be able to sample, which is known as the law of the unconscious statistician (LOTUS).

Therefore, in this class,  $f$  is assumed to be a `pixyz.Loss`.

### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal, Bernoulli
>>> from pixyz.losses import LogProb
>>> q = Normal(loc="x", scale=torch.tensor(1.), var=["z"], cond_var=["x"],
...             features_shape=[10]) # q(z|x)
>>> p = Normal(loc="z", scale=torch.tensor(1.), var=["x"], cond_var=["z"],
...             features_shape=[10]) # p(x|z)
>>> loss_cls = LogProb(p).expectation(q) # equals to Expectation(q, LogProb(p))
>>> print(loss_cls)
\mathbb{E}\{p(z|x)\} \left[\log p(x|z) \right]
>>> sample_x = torch.randn(2, 10) # Psuedo data
>>> loss = loss_cls.eval({"x": sample_x})
>>> print(loss) # doctest: +SKIP
tensor([-12.8181, -12.6062])
>>> loss_cls = LogProb(p).expectation(q, sample_shape=(5,))
>>> loss = loss_cls.eval({"x": sample_x})
>>> print(loss) # doctest: +SKIP
>>> q = Bernoulli(probs=torch.tensor(0.5), var=["x"], cond_var=[], features_
... shape=[10]) # q(x)
>>> p = Bernoulli(probs=torch.tensor(0.3), var=["x"], cond_var=[], features_
... shape=[10]) # p(x)
>>> loss_cls = p.log_prob().expectation(q, sample_shape=[64])
>>> train_loss = loss_cls.eval()
>>> print(train_loss) # doctest: +SKIP
tensor([46.7559])
>>> eval_loss = loss_cls.eval(test_mode=True)
>>> print(eval_loss) # doctest: +SKIP
tensor([-7.6047])
```

`forward(x_dict={}, **kwargs)`

**Parameters** `x_dict` (`dict`) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

## 2.3.2 REINFORCE

`pixyz.losses.REINFORCE(p, f, b=0, sample_shape=torch.Size([1]), reparam=True)`

Surrogate Loss for Policy Gradient Method (REINFORCE) with a given reward function  $f$  and a given baseline  $b$ .

$$\mathbb{E}_{p(x)}[detach(f(x) - b(x)) \log p(x) + f(x) - b(x)].$$

in this function,  $f$  and  $b$  is assumed to `pixyz.Loss`.

### Parameters

- **p** (`pixyz.distributions.Distribution`) – Distribution for expectation.
- **f** (`pixyz.losses.Loss`) – reward function
- **b** (`pixyz.losses.Loss` default to `pixyz.losses.ValueLoss(0)`) – baseline function
- **sample\_shape** (`torch.Size` default to `torch.Size([1])`) – sample size for expectation
- **reparam** – using reparameterization in internal sampling

**Returns** `surrogate_loss` – policy gradient can be calculated from a gradient of this surrogate loss.

**Return type** `pixyz.losses.Loss`

### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal, Bernoulli
>>> from pixyz.losses import LogProb
>>> q = Bernoulli(probs=torch.tensor(0.5), var=["x"], cond_var=[], features_
    ↵shape=[10]) # q(x)
>>> p = Bernoulli(probs=torch.tensor(0.3), var=["x"], cond_var=[], features_
    ↵shape=[10]) # p(x)
>>> loss_cls = REINFORCE(q,p.log_prob(),sample_shape=[64])
>>> train_loss = loss_cls.eval(test_mode=True)
>>> print(train_loss) # doctest: +SKIP
tensor([46.7559])
>>> loss_cls = p.log_prob().expectation(q,sample_shape=[64])
>>> test_loss = loss_cls.eval()
>>> print(test_loss) # doctest: +SKIP
tensor([-7.6047])
```

## 2.4 Entropy

### 2.4.1 Entropy

`pixyz.losses.Entropy(p, analytical=True, sample_shape=torch.Size([1]))`

Entropy (Analytical or Monte Carlo approximation).

$$H(p) = -\mathbb{E}_{p(x)}[\log p(x)] \quad (\text{analytical})$$

$$\approx -\frac{1}{L} \sum_{l=1}^L \log p(x_l), \quad \text{where } x_l \sim p(x) \quad (\text{MC approximation}).$$

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> p = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"], features_
->shape=[64])
>>> loss_cls = Entropy(p, analytical=True)
>>> print(loss_cls)
H \left[ \{p(x)\} \right]
>>> loss_cls.eval()
tensor([90.8121])
>>> loss_cls = Entropy(p, analytical=False, sample_shape=[10])
>>> print(loss_cls)
- \mathbb{E}_{\{p(x)\}} \left[ \log p(x) \right]
>>> loss_cls.eval() # doctest: +SKIP
tensor([90.5991])
```

## 2.4.2 CrossEntropy

`pixyz.losses.CrossEntropy(p, q, analytical=False, sample_shape=torch.Size([1]))`

Cross entropy, a.k.a., the negative expected value of log-likelihood (Monte Carlo approximation or Analytical).

$$\begin{aligned} H(p, q) &= -\mathbb{E}_{p(x)}[\log q(x)] \quad (\text{analytical}) \\ &\approx -\frac{1}{L} \sum_{l=1}^L \log q(x_l), \quad \text{where } x_l \sim p(x) \quad (\text{MC approximation}). \end{aligned}$$

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> p = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"], features_
->shape=[64], name="p")
>>> q = Normal(loc=torch.tensor(1.), scale=torch.tensor(1.), var=["x"], features_
->shape=[64], name="q")
>>> loss_cls = CrossEntropy(p,q,analytical=True)
>>> print(loss_cls)
D_{KL} \left[ p(x) || q(x) \right] + H \left[ \{p(x)\} \right]
>>> loss_cls.eval()
tensor([122.8121])
>>> loss_cls = CrossEntropy(p,q,analytical=False, sample_shape=[10])
>>> print(loss_cls)
- \mathbb{E}_{\{p(x)\}} \left[ \log q(x) \right]
>>> loss_cls.eval() # doctest: +SKIP
tensor([123.2192])
```

## 2.5 Lower bound

### 2.5.1 ELBO

`pixyz.losses.ELBO(p, q, sample_shape=torch.Size([1]))`

The evidence lower bound (Monte Carlo approximation).

$$\mathbb{E}_{q(z|x)} \left[ \log \frac{p(x, z)}{q(z|x)} \right] \approx \frac{1}{L} \sum_{l=1}^L \log p(x, z_l), \quad \text{where } z_l \sim q(z|x).$$

---

**Note:** This class is a special case of the *Expectation* class.

---

### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> q = Normal(loc="x", scale=torch.tensor(1.), var=["z"], cond_var=["x"], ↵
    ↵features_shape=[64]) # q(z|x)
>>> p = Normal(loc="z", scale=torch.tensor(1.), var=["x"], cond_var=["z"], ↵
    ↵features_shape=[64]) # p(x|z)
>>> loss_cls = ELBO(p,q)
>>> print(loss_cls)
\mathbb{E}\{p(z|x)\} \left[ \log p(x|z) - \log p(z|x) \right]
>>> loss = loss_cls.eval({"x": torch.randn(1, 64)})
```

## 2.6 Statistical distance

### 2.6.1 KullbackLeibler

`pixyz.losses.KullbackLeibler(p, q, dim=None, analytical=True, sample_shape=torch.Size([1]))`

Kullback-Leibler divergence (analytical or Monte Carlo Appoximation).

$$D_{KL}[p||q] = \mathbb{E}_{p(x)} \left[ \log \frac{p(x)}{q(x)} \right] \quad (\text{analytical})$$

$$\approx \frac{1}{L} \sum_{l=1}^L \log \frac{p(x_l)}{q(x_l)}, \quad \text{where } x_l \sim p(x) \quad (\text{MC approximation}).$$

### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal, Beta
>>> p = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["z"], features_ ↵
    ↵shape=[64], name="p")
>>> q = Normal(loc=torch.tensor(1.), scale=torch.tensor(1.), var=["z"], features_ ↵
    ↵shape=[64], name="q")
>>> loss_cls = KullbackLeibler(p,q,analytical=True)
```

(continues on next page)

(continued from previous page)

```
>>> print(loss_cls)
D_{KL} \left[ p(z) || q(z) \right]
>>> loss_cls.eval()
tensor([32.])
>>> loss_cls = KullbackLeibler(p, q, analytical=False, sample_shape=[64])
>>> print(loss_cls)
\mathbb{E}_{\{p(z)\}} \left[ \log p(z) - \log q(z) \right]
>>> loss_cls.eval() # doctest: +SKIP
tensor([31.4713])
```

## 2.6.2 WassersteinDistance

**class** `pixyz.losses.WassersteinDistance`(*p, q, metric=PairwiseDistance()*)  
Bases: `pixyz.losses.losses.Divergence`

Wasserstein distance.

$$W(p, q) = \inf_{\Gamma \in \mathcal{P}(x_p \sim p, x_q \sim q)} \mathbb{E}_{(x_p, x_q) \sim \Gamma} [d(x_p, x_q)]$$

However, instead of the above true distance, this class computes the following one.

$$W'(p, q) = \mathbb{E}_{x_p \sim p, x_q \sim q} [d(x_p, x_q)].$$

Here,  $W'$  is the upper of  $W$  (i.e.,  $W \leq W'$ ), and these are equal when both  $p$  and  $q$  are degenerate (deterministic) distributions.

### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> p = Normal(loc="x", scale=torch.tensor(1.), var=["z"], cond_var=["x"], ↵
    ↵features_shape=[64], name="p")
>>> q = Normal(loc="x", scale=torch.tensor(1.), var=["z"], cond_var=["x"], ↵
    ↵features_shape=[64], name="q")
>>> loss_cls = WassersteinDistance(p, q)
>>> print(loss_cls)
W^{upper} \left[ p(z|x), q(z|x) \right]
>>> loss = loss_cls.eval({ "x": torch.randn(1, 64) })
```

**forward**(*x\_dict, \*\*kwargs*)

**Parameters** `x_dict`(*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

## 2.6.3 MMD

**class** `pixyz.losses.MMD`(*p, q, kernel='gaussian', \*\*kernel\_params*)  
Bases: `pixyz.losses.losses.Divergence`

The Maximum Mean Discrepancy (MMD).

$$D_{MMD^2}[p||q] = \mathbb{E}_{p(x), p(x')}[k(x, x')] + \mathbb{E}_{q(x), q(x')}[k(x, x')] - 2\mathbb{E}_{p(x), q(x')}[k(x, x')]$$

where  $k(x, x')$  is any positive definite kernel.

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> p = Normal(loc="x", scale=torch.tensor(1.), var=["z"], cond_var=["x"], ↵
    ↵features_shape=[64], name="p")
>>> q = Normal(loc="x", scale=torch.tensor(1.), var=["z"], cond_var=["x"], ↵
    ↵features_shape=[64], name="q")
>>> loss_cls = MMD(p, q, kernel="gaussian")
>>> print(loss_cls)
D_{MMD^2} \left[ p(z|x) || q(z|x) \right]
>>> loss = loss_cls.eval({"x": torch.randn(1, 64)})
>>> # Use the inverse (multi-)quadric kernel
>>> loss = MMD(p, q, kernel="inv-multiquadratic").eval({"x": torch.randn(10, 64)})
```

**forward**(*x\_dict*={}, \*\**kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

## 2.7 Adversarial statistical distance

### 2.7.1 AdversarialJensenShannon

```
class pixyz.losses.AdversarialJensenShannon(p, q, discriminator, optimizer=<class
                                             'torch.optim.adam.Adam'>, optimizer_params={}, inverse_g_loss=True)
```

Bases: `pixyz.losses.adversarial_loss.AdversarialLoss`

Jensen-Shannon divergence (adversarial training).

$$D_{JS}[p(x)||q(x)] \leq 2 \cdot D_{JS}[p(x)||q(x)] + 2 \log 2 = \mathbb{E}_{p(x)}[\log d^*(x)] + \mathbb{E}_{q(x)}[\log(1 - d^*(x))],$$

where  $d^*(x) = \arg \max_d \mathbb{E}_{p(x)}[\log d(x)] + \mathbb{E}_{q(x)}[\log(1 - d(x))]$ .

This class acts as a metric that evaluates a given distribution (generator). If you want to learn this evaluation metric itself, i.e., discriminator (critic), use the `train` method.

## Examples

```

>>> import torch
>>> from pixyz.distributions import Deterministic, EmpiricalDistribution, Normal
>>> # Generator
>>> class Generator(Deterministic):
...     def __init__(self):
...         super(Generator, self).__init__(var=["x"], cond_var=["z"], name="p")
...         self.model = nn.Linear(32, 64)
...     def forward(self, z):
...         return {"x": self.model(z)}
>>> p_g = Generator()
>>> prior = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.),
...                  var=["z"], features_shape=[32], name="p_{prior}")
>>> p = (p_g*prior).marginalize_var("z")
>>> print(p)
Distribution:
p(x) = \int p(x|z)p_{prior}(z)dz
Network architecture:
p_{prior}(z):
Normal(
    name=p_{prior}, distribution_name=Normal,
    var=['z'], cond_var=[], input_var=[], features_shape=torch.Size([32])
    (loc): torch.Size([1, 32])
    (scale): torch.Size([1, 32])
)
p(x|z):
Generator(
    name=p, distribution_name=Deterministic,
    var=['x'], cond_var=['z'], input_var=['z'], features_shape=torch.Size([])
    (model): Linear(in_features=32, out_features=64, bias=True)
)
>>> # Data distribution (dummy distribution)
>>> p_data = EmpiricalDistribution(["x"])
>>> print(p_data)
Distribution:
p_{data}(x)
Network architecture:
EmpiricalDistribution(
    name=p_{data}, distribution_name=Data distribution,
    var=['x'], cond_var=[], input_var=['x'], features_shape=torch.Size([])
)
>>> # Discriminator (critic)
>>> class Discriminator(Deterministic):
...     def __init__(self):
...         super(Discriminator, self).__init__(var=["t"], cond_var=["x"], name="d")
...         self.model = nn.Linear(64, 1)
...     def forward(self, x):
...         return {"t": torch.sigmoid(self.model(x))}
>>> d = Discriminator()
>>> print(d)
Distribution:
d(t|x)
Network architecture:
Discriminator(
    name=d, distribution_name=Deterministic,
    var=['t'], cond_var=['x'], input_var=['x'], features_shape=torch.Size([])
    (model): Linear(in_features=64, out_features=1, bias=True)
)

```

(continues on next page)

(continued from previous page)

```

)
>>>
>>> # Set the loss class
>>> loss_cls = AdversarialJensenShannon(p, p_data, discriminator=d)
>>> print(loss_cls)
mean(D_{JS}^{Adv} \left[ p(x) || p_{\text{data}}(x) \right])
>>>
>>> sample_x = torch.randn(2, 64) # Psuedo data
>>> loss = loss_cls.eval({ "x": sample_x })
>>> print(loss) # doctest: +SKIP
tensor(1.3723, grad_fn=<AddBackward0>)
>>> # For evaluating a discriminator loss, set the `discriminator` option to True.
>>> loss_d = loss_cls.eval({ "x": sample_x }, discriminator=True)
>>> print(loss_d) # doctest: +SKIP
tensor(1.4990, grad_fn=<AddBackward0>)
>>> # When training the evaluation metric (discriminator), use the train method.
>>> train_loss = loss_cls.loss_train({ "x": sample_x })

```

[Goodfellow+ 2014] Generative Adversarial Networks

**forward**(*x\_dict*, *discriminator=False*, *\*\*kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

**d\_loss**(*y\_p*, *y\_q*, *batch\_n*)

Evaluate a discriminator loss given outputs of the discriminator.

**Parameters**

- **y\_p** (`torch.Tensor`) – Output of discriminator given sample from p.
- **y\_q** (`torch.Tensor`) – Output of discriminator given sample from q.
- **batch\_n** (`int`) – Batch size of inputs.

**Returns**

**Return type** `torch.Tensor`

**g\_loss**(*y\_p*, *y\_q*, *batch\_n*)

Evaluate a generator loss given outputs of the discriminator.

**Parameters**

- **y\_p** (`torch.Tensor`) – Output of discriminator given sample from p.
- **y\_q** (`torch.Tensor`) – Output of discriminator given sample from q.
- **batch\_n** (`int`) – Batch size of inputs.

**Returns**

**Return type** `torch.Tensor`

**loss\_train**(*train\_x\_dict*, \*\**kwargs*)  
Train the evaluation metric (discriminator).

**Parameters**

- **train\_x\_dict** (*dict*) – Input variables.
- **\*\*kwargs** – Arbitrary keyword arguments.

**Returns loss****Return type** torch.Tensor

**loss\_test**(*test\_x\_dict*, \*\**kwargs*)  
Test the evaluation metric (discriminator).

**Parameters**

- **test\_x\_dict** (*dict*) – Input variables.
- **\*\*kwargs** – Arbitrary keyword arguments.

**Returns loss****Return type** torch.Tensor

## 2.7.2 AdversarialKullbackLeibler

```
class pixyz.losses.AdversarialKullbackLeibler(p, q, discriminator, **kwargs)
Bases: pixyz.losses.adversarial_loss.AdversarialLoss
```

Kullback-Leibler divergence (adversarial training).

$$D_{KL}[p(x)||q(x)] = \mathbb{E}_{p(x)} \left[ \log \frac{p(x)}{q(x)} \right] \approx \mathbb{E}_{p(x)} \left[ \log \frac{d^*(x)}{1 - d^*(x)} \right],$$

where  $d^*(x) = \arg \max_d \mathbb{E}_{q(x)}[\log d(x)] + \mathbb{E}_{p(x)}[\log(1 - d(x))]$ .

Note that this divergence is minimized to close *p* to *q*.

### Examples

```
>>> import torch
>>> from pixyz.distributions import Deterministic, EmpiricalDistribution, Normal
>>> # Generator
>>> class Generator(Deterministic):
...     def __init__(self):
...         super(Generator, self).__init__(var=["x"], cond_var=["z"], name="p")
...         self.model = nn.Linear(32, 64)
...     def forward(self, z):
...         return {"x": self.model(z)}
>>> p_g = Generator()
>>> prior = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.),
...                  var=["z"], features_shape=[32], name="p_(prior)")
>>> p = (p_g*prior).marginalize_var("z")
>>> print(p)
Distribution:
p(x) = \int p(x|z)p_{prior}(z)dz
Network architecture:
p_{prior}(z):
```

(continues on next page)

[Kim+ 2018] Disentangling by Factorising

**forward**(*x\_dict*, *discriminator=False*, *\*\*kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

**g\_loss**(*y\_p*, *batch\_n*)

Evaluate a generator loss given an output of the discriminator.

**Parameters**

- **y\_p** (`torch.Tensor`) – Output of discriminator given sample from p.
- **batch\_n** (*int*) – Batch size of inputs.

**Returns**

**Return type** `torch.Tensor`

**d\_loss**(*y\_p*, *y\_q*, *batch\_n*)

Evaluate a discriminator loss given outputs of the discriminator.

**Parameters**

- **y\_p** (`torch.Tensor`) – Output of discriminator given sample from p.
- **y\_q** (`torch.Tensor`) – Output of discriminator given sample from q.
- **batch\_n** (*int*) – Batch size of inputs.

**Returns**

**Return type** `torch.Tensor`

**loss\_train**(*train\_x\_dict*, *\*\*kwargs*)

Train the evaluation metric (discriminator).

**Parameters**

- **train\_x\_dict** (*dict*) – Input variables.
- **\*\*kwargs** – Arbitrary keyword arguments.

**Returns** **loss**

**Return type** `torch.Tensor`

**loss\_test**(*test\_x\_dict*, *\*\*kwargs*)

Test the evaluation metric (discriminator).

**Parameters**

- **test\_x\_dict** (*dict*) – Input variables.
- **\*\*kwargs** – Arbitrary keyword arguments.

**Returns loss****Return type** torch.Tensor

### 2.7.3 AdversarialWassersteinDistance

```
class pixyz.losses.AdversarialWassersteinDistance(p, q, discriminator,  

                                                 clip_value=0.01, **kwargs)
```

Bases: pixyz.losses.adversarial\_loss.AdversarialJensenShannon

Wasserstein distance (adversarial training).

$$W(p, q) = \sup_{\|d\|_L \leq 1} \mathbb{E}_{p(x)}[d(x)] - \mathbb{E}_{q(x)}[d(x)]$$

### Examples

```
>>> import torch
>>> from pixyz.distributions import Deterministic, EmpiricalDistribution, Normal
>>> # Generator
>>> class Generator(Deterministic):
...     def __init__(self):
...         super(Generator, self). __init__(var=["x"], cond_var=["z"], name="p")
...         self.model = nn.Linear(32, 64)
...     def forward(self, z):
...         return {"x": self.model(z)}
>>> p_g = Generator()
>>> prior = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.),
...                  var=["z"], features_shape=[32], name="p_{prior}")

## References

[Arjovsky+ 2017] Wasserstein GAN

**d\_loss**(y\_p, y\_q, \*args, \*\*kwargs)

Evaluate a discriminator loss given outputs of the discriminator.

### Parameters

- **y\_p**(*torch.Tensor*) – Output of discriminator given sample from p.
- **y\_q**(*torch.Tensor*) – Output of discriminator given sample from q.
- **batch\_n**(*int*) – Batch size of inputs.

### Returns

**Return type** *torch.Tensor*

**g\_loss**(y\_p, y\_q, \*args, \*\*kwargs)

Evaluate a generator loss given outputs of the discriminator.

### Parameters

- **y\_p** (`torch.Tensor`) – Output of discriminator given sample from p.
- **y\_q** (`torch.Tensor`) – Output of discriminator given sample from q.
- **batch\_n** (`int`) – Batch size of inputs.

**Returns**

**Return type** `torch.Tensor`

**loss\_train** (`train_x_dict`, `**kwargs`)

Train the evaluation metric (discriminator).

**Parameters**

- **train\_x\_dict** (`dict`) – Input variables.
- **\*\*kwargs** – Arbitrary keyword arguments.

**Returns loss**

**Return type** `torch.Tensor`

**loss\_test** (`test_x_dict`, `**kwargs`)

Test the evaluation metric (discriminator).

**Parameters**

- **test\_x\_dict** (`dict`) – Input variables.
- **\*\*kwargs** – Arbitrary keyword arguments.

**Returns loss**

**Return type** `torch.Tensor`

## 2.8 Loss for sequential distributions

### 2.8.1 IterativeLoss

```
class pixyz.losses.IterativeLoss(step_loss, max_iter=None, series_var=(), update_value={},
                                 slice_step=None, timestep_var=())
Bases: pixyz.losses.Loss
```

Iterative loss.

This class allows implementing an arbitrary model which requires iteration.

$$\mathcal{L} = \sum_{t=0}^{T-1} \mathcal{L}_{step}(x_t, h_t),$$

where  $x_t = f_{slice\_step}(x, t)$ .

### Examples

```

```

**slice\_step\_fn**( $t, x$ )

**forward**( $x\_dict, \*\*kwargs$ )

**Parameters** `x_dict` (`dict`) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

## 2.9 Loss for special purpose

### 2.9.1 Parameter

```
class pixyz.losses.losses.Parameter(input_var)
Bases: pixyz.losses.losses.Loss
```

This class defines a single variable as a loss class.

It can be used such as a coefficient parameter of a loss class.

#### Examples

```
>>> loss_cls = Parameter("x")
>>> print(loss_cls)
x
>>> loss = loss_cls.eval({"x": 2})
>>> print(loss)
2
```

```
forward(x_dict={}, **kwargs)
```

**Parameters** `x_dict` (`dict`) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

### 2.9.2 ValueLoss

```
class pixyz.losses.losses.ValueLoss(loss1)
Bases: pixyz.losses.losses.Loss
```

This class contains a scalar as a loss value.

If multiplying a scalar by an arbitrary loss class, this scalar is converted to the `ValueLoss`.

#### Examples

```
>>> loss_cls = ValueLoss(2)
>>> print(loss_cls)
2
>>> loss = loss_cls.eval()
>>> print(loss)
tensor(2.)
```

---

```
forward(x_dict={}, **kwargs)
```

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calcuated loss and updated all samples.*

### 2.9.3 ConstantVar

```
class pixyz.losses.losses.ConstantVar(base_loss, constant_dict)
```

Bases: `pixyz.losses.losses.Loss`

This class is defined as a loss class that makes the value of a variable a constant before evaluation. It can be used to fix the coefficient parameters of the loss class or to condition random variables.

#### Examples

```
>>> loss_cls = Parameter('x').constant_var({'x': 1})
>>> print(loss_cls)
x
>>> loss = loss_cls.eval()
>>> print(loss)
1
```

```
forward(x_dict={}, **kwargs)
```

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calcuated loss and updated all samples.*

## 2.10 Operators

### 2.10.1 LossOperator

```
class pixyz.losses.losses.LossOperator(loss1, loss2)
```

Bases: `pixyz.losses.losses.Loss`

```
forward(x_dict={}, **kwargs)
```

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calcuated loss and updated all samples.*

## 2.10.2 LossSelfOperator

```
class pixyz.losses.losses.LossSelfOperator(loss1)
    Bases: pixyz.losses.losses.Loss

    loss_train(x_dict={}, **kwargs)
    loss_test(x_dict={}, **kwargs)
```

## 2.10.3 AddLoss

```
class pixyz.losses.losses.AddLoss(loss1, loss2)
    Bases: pixyz.losses.losses.LossOperator
```

Apply the *add* operation to the two losses.

### Examples

```
>>> loss_cls_1 = ValueLoss(2)
>>> loss_cls_2 = Parameter("x")
>>> loss_cls = loss_cls_1 + loss_cls_2 # equals to AddLoss(loss_cls_1, loss_cls_
  ↵2)
>>> print(loss_cls)
x + 2
>>> loss = loss_cls.eval({"x": 3})
>>> print(loss)
tensor(5.)
```

**forward**(x\_dict={}, \*\*kwargs)

**Parameters** **x\_dict**(dict) – Input variables.

**Returns**

- a tuple of pixyz.losses.Loss and dict
- *deterministically calculated loss and updated all samples.*

## 2.10.4 SubLoss

```
class pixyz.losses.losses.SubLoss(loss1, loss2)
    Bases: pixyz.losses.losses.LossOperator
```

Apply the *sub* operation to the two losses.

### Examples

```
>>> loss_cls_1 = ValueLoss(2)
>>> loss_cls_2 = Parameter("x")
>>> loss_cls = loss_cls_1 - loss_cls_2 # equals to SubLoss(loss_cls_1, loss_cls_
  ↵2)
>>> print(loss_cls)
2 - x
>>> loss = loss_cls.eval({"x": 4})
>>> print(loss)
```

(continues on next page)

(continued from previous page)

```

tensor(-2.)
>>> loss_cls = loss_cls_2 - loss_cls_1 # equals to SubLoss(loss_cls_2, loss_cls_
    ↵1)
>>> print(loss_cls)
x - 2
>>> loss = loss_cls.eval({"x": 4})
>>> print(loss)
tensor(2.)

```

**forward**(*x\_dict*={}, \*\**kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

## 2.10.5 MulLoss

```

class pixyz.losses.losses.MulLoss(loss1, loss2)
Bases: pixyz.losses.losses.LossOperator

```

Apply the *mul* operation to the two losses.

### Examples

```

>>> loss_cls_1 = ValueLoss(2)
>>> loss_cls_2 = Parameter("x")
>>> loss_cls = loss_cls_1 * loss_cls_2 # equals to MulLoss(loss_cls_1, loss_cls_
    ↵2)
>>> print(loss_cls)
2 x
>>> loss = loss_cls.eval({"x": 4})
>>> print(loss)
tensor(8.)

```

**forward**(*x\_dict*={}, \*\**kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

## 2.10.6 DivLoss

```

class pixyz.losses.losses.DivLoss(loss1, loss2)
Bases: pixyz.losses.losses.LossOperator

```

Apply the *div* operation to the two losses.

## Examples

```
>>> loss_cls_1 = ValueLoss(2)
>>> loss_cls_2 = Parameter("x")
>>> loss_cls = loss_cls_1 / loss_cls_2 # equals to DivLoss(loss_cls_1, loss_cls_
->2)
>>> print(loss_cls)
\frac{2}{x}
>>> loss = loss_cls.eval({"x": 4})
>>> print(loss)
tensor(0.5000)
>>> loss_cls = loss_cls_2 / loss_cls_1 # equals to DivLoss(loss_cls_2, loss_cls_
->1)
>>> print(loss_cls)
\frac{x}{2}
>>> loss = loss_cls.eval({"x": 4})
>>> print(loss)
tensor(2.)
```

**forward**(*x\_dict*={}, \*\**kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

## 2.10.7 MinLoss

**class** `pixyz.losses.losses.MinLoss`(*loss1*, *loss2*)  
Bases: `pixyz.losses.losses.LossOperator`

Apply the *min* operation to the loss.

## Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> from pixyz.losses.losses import ValueLoss, Parameter, MinLoss
>>> loss_min= MinLoss(ValueLoss(3), ValueLoss(1))
>>> print(loss_min)
min \left(3, 1\right)
>>> print(loss_min.eval())
tensor(1.)
```

**forward**(*x\_dict*={}, \*\**kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

## 2.10.8 MaxLoss

```
class pixyz.losses.losses.MaxLoss (loss1, loss2)
Bases: pixyz.losses.losses.LossOperator
```

Apply the *max* operation to the loss.

### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> from pixyz.losses.losses import ValueLoss, MaxLoss
>>> loss_max= MaxLoss(ValueLoss(3), ValueLoss(1))
>>> print(loss_max)
max \left(3, 1\right)
>>> print(loss_max.eval())
tensor(3.)
```

**forward** (*x\_dict*={}, \*\**kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of *pixyz.losses.Loss* and *dict*
- *deterministically calcurated loss and updated all samples.*

## 2.10.9 NegLoss

```
class pixyz.losses.losses.NegLoss (loss1)
Bases: pixyz.losses.losses.LossSelfOperator
```

Apply the *neg* operation to the loss.

### Examples

```
>>> loss_cls_1 = Parameter("x")
>>> loss_cls = -loss_cls_1 # equals to NegLoss(loss_cls_1)
>>> print(loss_cls)
- x
>>> loss = loss_cls.eval({ "x": 4 })
>>> print(loss)
-4
```

**forward** (*x\_dict*={}, \*\**kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of *pixyz.losses.Loss* and *dict*
- *deterministically calcurated loss and updated all samples.*

## 2.10.10 AbsLoss

```
class pixyz.losses.losses.AbsLoss (loss1)
Bases: pixyz.losses.losses.LossSelfOperator
```

Apply the *abs* operation to the loss.

### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> from pixyz.losses import LogProb
>>> p = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...               features_shape=[10])
>>> loss_cls = LogProb(p).abs() # equals to AbsLoss(LogProb(p))
>>> print(loss_cls)
| \log p(x) |
>>> sample_x = torch.randn(2, 10) # Psuedo data
>>> loss = loss_cls.eval({"x": sample_x})
>>> print(loss) # doctest: +SKIP
tensor([12.9894, 15.5280])
```

**forward** (*x\_dict*={}, \*\**kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of *pixyz.losses.Loss* and *dict*
- *deterministically calcurated loss and updated all samples.*

## 2.10.11 BatchMean

```
class pixyz.losses.losses.BatchMean (loss1)
Bases: pixyz.losses.losses.LossSelfOperator
```

Average a loss class over given batch data.

$$\mathbb{E}_{p_{data}(x)}[\mathcal{L}(x)] \approx \frac{1}{N} \sum_{i=1}^N \mathcal{L}(x_i),$$

where  $x_i \sim p_{data}(x)$  and  $\mathcal{L}$  is a loss function.

### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> from pixyz.losses import LogProb
>>> p = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=["x"],
...               features_shape=[10])
>>> loss_cls = LogProb(p).mean() # equals to BatchMean(LogProb(p))
>>> print(loss_cls)
mean \left(\log p(x) \right)
>>> sample_x = torch.randn(2, 10) # Psuedo data
```

(continues on next page)

(continued from previous page)

```
>>> loss = loss_cls.eval({"x": sample_x})
>>> print(loss) # doctest: +SKIP
tensor(-14.5038)
```

**forward**(*x\_dict*={}, \*\**kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

## 2.10.12 BatchSum

```
class pixyz.losses.losses.BatchSum(loss1)
Bases: pixyz.losses.losses.LossSelfOperator
```

Summation a loss class over given batch data.

$$\sum_{i=1}^N \mathcal{L}(x_i),$$

where  $x_i \sim p_{data}(x)$  and  $\mathcal{L}$  is a loss function.

### Examples

```
>>> import torch
>>> from pixyz.distributions import Normal
>>> from pixyz.losses import LogProb
>>> p = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.), var=[ "x" ],
...               features_shape=[10])
>>> loss_cls = LogProb(p).sum() # equals to BatchSum(LogProb(p))
>>> print(loss_cls)
sum \left(\log p(x) \right)
>>> sample_x = torch.randn(2, 10) # Psuedo data
>>> loss = loss_cls.eval({"x": sample_x})
>>> print(loss) # doctest: +SKIP
tensor(-31.9434)
```

**forward**(*x\_dict*={}, \*\**kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calculated loss and updated all samples.*

## 2.10.13 Detach

```
class pixyz.losses.losses.Detach(loss1)
Bases: pixyz.losses.losses.LossSelfOperator
```

Apply the *detach* method to the loss.

```
forward(x_dict={}, **kwargs)
```

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calcuated loss and updated all samples.*

## 2.10.14 DataParallelLoss

```
class pixyz.losses.losses.DataParallelLoss(loss, distributed=False, **kwargs)
```

Bases: `pixyz.losses.losses.Loss`

Loss class wrapper of `torch.nn.DataParallel`. It can be used as the original loss class. `eval` & `forward` methods support data-parallel running.

### Examples

```
>>> import torch
>>> from torch import optim
>>> from torch.nn import functional as F
>>> from pixyz.distributions import Bernoulli, Normal
>>> from pixyz.losses import KullbackLeibler, DataParallelLoss
>>> from pixyz.models import Model
>>> used_gpu_i = set()
>>> used_gpu_g = set()
>>> # Set distributions (Distribution API)
>>> class Inference(Normal):
...     def __init__(self):
...         super().__init__(var=["z"], cond_var=["x"], name="q")
...         self.model_loc = torch.nn.Linear(128, 64)
...         self.model_scale = torch.nn.Linear(128, 64)
...     def forward(self, x):
...         used_gpu_i.add(x.device.index)
...         return {"loc": self.model_loc(x), "scale": F.softplus(self.model_
... scale(x))}
>>> class Generator(Bernoulli):
...     def __init__(self):
...         super().__init__(var=["x"], cond_var=["z"], name="p")
...         self.model = torch.nn.Linear(64, 128)
...     def forward(self, z):
...         used_gpu_g.add(z.device.index)
...         return {"probs": torch.sigmoid(self.model(z))}
>>> p = Generator()
>>> q = Inference()
>>> prior = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.),
...                  var=["z"], features_shape=[64], name="p_{prior}")
>>> # Define a loss function (Loss API)
>>> reconst = -p.log_prob().expectation(q)
>>> kl = KullbackLeibler(q, prior)
>>> batch_loss_cls = (reconst - kl)
>>> # device settings
>>> device = torch.device("cuda:0" if torch.cuda.is_available() else "cpu")
>>> device_count = torch.cuda.device_count()
>>> if device_count > 1:
```

(continues on next page)

(continued from previous page)

```

...     loss_cls = DataParalleledLoss(batch_loss_cls).mean().to(device)
... else:
...     loss_cls = batch_loss_cls.mean().to(device)
>>> # Set a model (Model API)
>>> model = Model(loss=loss_cls, distributions=[p, q],
...                  optimizer=optim.Adam, optimizer_params={"lr": 1e-3})
>>> # Train and test the model
>>> data = torch.randn(2, 128).to(device) # Pseudo data
>>> train_loss = model.train({"x": data})
>>> expected = set(range(device_count)) if torch.cuda.is_available() else {None}
>>> assert used_gpu_i==expected
>>> assert used_gpu_g==expected

```

**forward**(*x\_dict*, \*\**kwargs*)

**Parameters** **x\_dict** (*dict*) – Input variables.

**Returns**

- a tuple of `pixyz.losses.Loss` and `dict`
- *deterministically calcuated loss and updated all samples.*

# CHAPTER 3

## pixyz.models (Model API)

### 3.1 Model

```
class pixyz.models.Model(loss,      test_loss=None,      distributions=[],      optimizer=<class
                           'torch.optim.adam.Adam'>,      optimizer_params={},
                           clip_grad_norm=None, clip_grad_value=None)
Bases: object
```

This class is for training and testing a loss class. It requires a defined loss class, distributions to train, and optimizer for initialization.

#### Examples

```
>>> import torch
>>> from torch import optim
>>> from torch.nn import functional as F
>>> from pixyz.distributions import Bernoulli, Normal
>>> from pixyz.losses import KullbackLeibler
...
>>> # Set distributions (Distribution API)
>>> class Inference(Normal):
...     def __init__(self):
...         super().__init__(var=["z"], cond_var=["x"], name="q")
...         self.model_loc = torch.nn.Linear(128, 64)
...         self.model_scale = torch.nn.Linear(128, 64)
...     def forward(self, x):
...         return {"loc": self.model_loc(x), "scale": F.softplus(self.model_
...         + scale(x))}
...
>>> class Generator(Bernoulli):
...     def __init__(self):
...         super().__init__(var=["x"], cond_var=["z"], name="p")
...         self.model = torch.nn.Linear(64, 128)
```

(continues on next page)

(continued from previous page)

```

...
    def forward(self, z):
...
        return {"probs": torch.sigmoid(self.model(z))}

...
>>> p = Generator()
>>> q = Inference()
>>> prior = Normal(loc=torch.tensor(0.), scale=torch.tensor(1.),
...                  var=["z"], features_shape=[64], name="p_(prior)")
...
>>> # Define a loss function (Loss API)
>>> reconst = -p.log_prob().expectation(q)
>>> kl = KullbackLeibler(q,prior)
>>> loss_cls = (reconst - kl).mean()
>>> print(loss_cls)
mean \left(- D_{KL} \left[ q(z|x) || p_{prior}(z) \right] - \mathbb{E}_{q(z|x)} \left[ \log p(x|z) \right] \right)
>>>
>>> # Set a model (Model API)
>>> model = Model(loss=loss_cls, distributions=[p, q],
...                  optimizer=optim.Adam, optimizer_params={"lr": 1e-3})
>>> # Train and test the model
>>> data = torch.randn(1, 128) # Pseudo data
>>> train_loss = model.train({"x": data})
>>> test_loss = model.test({"x": data})

```

**\_\_init\_\_(loss, test\_loss=None, distributions=[], optimizer=<class 'torch.optim.adam.Adam'>, optimizer\_params={}, clip\_grad\_norm=None, clip\_grad\_value=None)**

#### Parameters

- **loss** (*pixyz.losses.Loss*) – Loss class for training.
- **test\_loss** (*pixyz.losses.Loss*) – Loss class for testing.
- **distributions** (*list*) – List of *pixyz.distributions.Distribution*.
- **optimizer** (*torch.optim*) – Optimization algorithm.
- **optimizer\_params** (*dict*) – Parameters of optimizer
- **clip\_grad\_norm** (*float or int*) – Maximum allowed norm of the gradients.
- **clip\_grad\_value** (*float or int*) – Maximum allowed value of the gradients.

**set\_loss** (*loss, test\_loss=None*)

**train** (*train\_x\_dict={}*, *\*\*kwargs*)

Train the model.

#### Parameters

- **train\_x\_dict** (*dict*) – Input data.
- **\*\*kwargs** –

**Returns** *loss* – Train loss value

**Return type** *torch.Tensor*

**test** (*test\_x\_dict={}*, *\*\*kwargs*)

Test the model.

#### Parameters

- **test\_x\_dict** (*dict*) – Input data

- **\*\*kwargs** –
- Returns** loss – Test loss value
- Return type** torch.Tensor

## 3.2 Pre-implementation models

### 3.2.1 ML

```
class pixyz.models.ML(p, other_distributions=[], optimizer=<class 'torch.optim.adam.Adam'>, optimizer_params={}, clip_grad_norm=False, clip_grad_value=False)
```

Bases: pixyz.models.model.Model

Maximum Likelihood (log-likelihood)

The negative log-likelihood of a given distribution (*p*) is set as the loss class of this model.

```
_init_(p, other_distributions=[], optimizer=<class 'torch.optim.adam.Adam'>, optimizer_params={}, clip_grad_norm=False, clip_grad_value=False)
```

#### Parameters

- **p** (*torch.distributions.Distribution*) – Classifier (distribution).
- **optimizer** (*torch.optim*) – Optimization algorithm.
- **optimizer\_params** (*dict*) – Parameters of optimizer
- **clip\_grad\_norm** (*float or int*) – Maximum allowed norm of the gradients.
- **clip\_grad\_value** (*float or int*) – Maximum allowed value of the gradients.

```
train(train_x_dict={}, **kwargs)
```

Train the model.

#### Parameters

- **train\_x\_dict** (*dict*) – Input data.
- **\*\*kwargs** –

**Returns** loss – Train loss value

**Return type** torch.Tensor

```
test(test_x_dict={}, **kwargs)
```

Test the model.

#### Parameters

- **test\_x\_dict** (*dict*) – Input data
- **\*\*kwargs** –

**Returns** loss – Test loss value

**Return type** torch.Tensor

### 3.2.2 VAE

```
class pixyz.models.VAE(encoder, decoder, other_distributions=[], regularizer=None, optimizer=<class 'torch.optim.adam.Adam'>, optimizer_params={}, clip_grad_norm=None, clip_grad_value=None)
Bases: pixyz.models.model.Model
```

Variational Autoencoder.

In VAE class, reconstruction loss on given distributions (encoder and decoder) is set as the default loss class. However, if you want to add additional terms, e.g., the KL divergence between encoder and prior, you need to set them to the *regularizer* argument, which defaults to None.

#### References

[Kingma+ 2013] Auto-Encoding Variational Bayes

```
__init__(encoder, decoder, other_distributions=[], regularizer=None, optimizer=<class 'torch.optim.adam.Adam'>, optimizer_params={}, clip_grad_norm=None, clip_grad_value=None)
```

##### Parameters

- **encoder** (`torch.distributions.Distribution`) – Encoder distribution.
- **decoder** (`torch.distributions.Distribution`) – Decoder distribution.
- **regularizer** (`torch.losses.Loss`, defaults to `None`) – If you want to add additional terms to the loss, set them to this argument.
- **optimizer** (`torch.optim`) – Optimization algorithm.
- **optimizer\_params** (`dict`) – Parameters of optimizer
- **clip\_grad\_norm** (`float or int`) – Maximum allowed norm of the gradients.
- **clip\_grad\_value** (`float or int`) – Maximum allowed value of the gradients.

```
train(train_x_dict={}, **kwargs)
```

Train the model.

##### Parameters

- **train\_x\_dict** (`dict`) – Input data.
- **\*\*kwargs** –

**Returns** `loss` – Train loss value

**Return type** `torch.Tensor`

```
test(test_x_dict={}, **kwargs)
```

Test the model.

##### Parameters

- **test\_x\_dict** (`dict`) – Input data
- **\*\*kwargs** –

**Returns** `loss` – Test loss value

**Return type** `torch.Tensor`

### 3.2.3 VI

```
class pixyz.models.VI(p, approximate_dist, other_distributions=[], optimizer=<class  
'torch.optim.adam.Adam'>, optimizer_params={}, clip_grad_norm=None,  
clip_grad_value=None)
```

Bases: pixyz.models.model.Model

Variational Inference (Amortized inference)

The ELBO for given distributions (*p*, *approximate\_dist*) is set as the loss class of this model.

```
__init__(p, approximate_dist, other_distributions=[], optimizer=<class 'torch.optim.adam.Adam'>,  
optimizer_params={}, clip_grad_norm=None, clip_grad_value=None)
```

#### Parameters

- **p** (*torch.distributions.Distribution*) – Generative model (distribution).
- **approximate\_dist** (*torch.distributions.Distribution*) – Approximate posterior distribution.
- **optimizer** (*torch.optim*) – Optimization algorithm.
- **optimizer\_params** (*dict*) – Parameters of optimizer
- **clip\_grad\_norm** (*float or int*) – Maximum allowed norm of the gradients.
- **clip\_grad\_value** (*float or int*) – Maximum allowed value of the gradients.

```
train(train_x_dict={}, **kwargs)
```

Train the model.

#### Parameters

- **train\_x\_dict** (*dict*) – Input data.
- **\*\*kwargs** –

**Returns** **loss** – Train loss value

**Return type** torch.Tensor

```
test(test_x_dict={}, **kwargs)
```

Test the model.

#### Parameters

- **test\_x\_dict** (*dict*) – Input data
- **\*\*kwargs** –

**Returns** **loss** – Test loss value

**Return type** torch.Tensor

### 3.2.4 GAN

```
class pixyz.models.GAN(p, discriminator, optimizer=<class 'torch.optim.adam.Adam'>, op  
timizer_params={}, d_optimizer=<class 'torch.optim.adam.Adam'>,  
d_optimizer_params={}, clip_grad_norm=None, clip_grad_value=None)
```

Bases: pixyz.models.model.Model

Generative Adversarial Network

(Adversarial) Jensen-Shannon divergence between given distributions (*p\_data*, *p*) is set as the loss class of this model.

## Examples

```

>>> import torch
>>> from torch import nn, optim
>>> from pixyz.distributions import Deterministic
>>> from pixyz.distributions import Normal
>>> from pixyz.models import GAN
>>> from pixyz.utils import print_latex
>>> x_dim = 128
>>> z_dim = 100
...
...
>>> # Set distributions (Distribution API)
...
...
>>> # generator model  $p(x|z)$ 
>>> class Generator(Deterministic):
...     def __init__(self):

**`__init__(p, discriminator, optimizer=<class 'torch.optim.adam.Adam'>, optimizer_params={}, d_optimizer=<class 'torch.optim.adam.Adam'>, d_optimizer_params={}, clip_grad_norm=None, clip_grad_value=None)`**

#### Parameters

- **p** (`torch.distributions.Distribution`) – Generative model (generator).
- **discriminator** (`torch.distributions.Distribution`) – Critic (discriminator).
- **optimizer** (`torch.optim`) – Optimization algorithm.
- **optimizer\_params** (`dict`) – Parameters of optimizer
- **clip\_grad\_norm** (`float or int`) – Maximum allowed norm of the gradients.
- **clip\_grad\_value** (`float or int`) – Maximum allowed value of the gradients.

**`train(train_x_dict={}, adversarial_loss=True, **kwargs)`**

Train the model.

#### Parameters

- **train\_x\_dict** (`dict, defaults to {}`) – Input data.
- **adversarial\_loss** (`bool, defaults to True`) – Whether to train the discriminator.
- **\*\*kwargs** –

#### Returns

- **loss** (`torch.Tensor`) – Train loss value.
- **d\_loss** (`torch.Tensor`) – Train loss value of the discriminator (if `adversarial_loss` is `True`).

**`test(test_x_dict={}, adversarial_loss=True, **kwargs)`**

Train the model.

#### Parameters

- **test\_x\_dict** (`dict, defaults to {}`) – Input data.
- **adversarial\_loss** (`bool, defaults to True`) – Whether to return the discriminator loss.
- **\*\*kwargs** –

#### Returns

- **loss** (`torch.Tensor`) – Test loss value.

- **d\_loss** (*torch.Tensor*) – Test loss value of the discriminator (if `adversarial_loss` is `True`).

# CHAPTER 4

---

## pixyz.flows (Flow layers)

---

### 4.1 Flow

```
class pixyz.flows.Flow(in_features)
```

Bases: torch.nn.modules.module.Module

Flow class. In Pixyz, all flows are required to inherit this class.

```
__init__(in_features)
```

**Parameters** `in_features` (`int`) – Size of input data.

```
in_features
```

```
forward(x, y=None, compute_jacobian=True)
```

Forward propagation of flow layers.

**Parameters**

- `x` (`torch.Tensor`) – Input data.
- `y` (`torch.Tensor`, *defaults to None*) – Data for conditioning.
- `compute_jacobian` (`bool`, *defaults to True*) – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in `logdet_jacobian`.

**Returns** `z`

**Return type** `torch.Tensor`

```
inverse(z, y=None)
```

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

**Parameters**

- `z` (`torch.Tensor`) – Input data.
- `y` (`torch.Tensor`, *defaults to None*) – Data for conditioning.

**Returns** `x`

**Return type** `torch.Tensor`

**logdet\_jacobian**

Get log-determinant Jacobian.

Before calling this, you should run `forward` or `update_jacobian` methods to calculate and store log-determinant Jacobian.

**class** `pixyz.flows.FlowList (flow_list)`

Bases: `pixyz.flows.flows.Flow`

**\_\_init\_\_ (flow\_list)**

Hold flow modules in a list.

Once initializing, it can be handled as a single flow module.

### Notes

Indexing is not supported for now.

**Parameters** `flow_list (list)` –

**forward (x, y=None, compute\_jacobian=True)**

Forward propagation of flow layers.

**Parameters**

- `x (torch.Tensor)` – Input data.
- `y (torch.Tensor, defaults to None)` – Data for conditioning.
- `compute_jacobian (bool, defaults to True)` – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in `logdet_jacobian`.

**Returns** `z`

**Return type** `torch.Tensor`

**inverse (z, y=None)**

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

**Parameters**

- `z (torch.Tensor)` – Input data.
- `y (torch.Tensor, defaults to None)` – Data for conditioning.

**Returns** `x`

**Return type** `torch.Tensor`

## 4.2 Normalizing flow

### 4.2.1 PlanarFlow

**class** `pixyz.flows.PlanarFlow (in_features, constraint_u=False)`

Bases: `pixyz.flows.flows.Flow`

Planar flow.

$$f(\mathbf{x}) = \mathbf{x} + \mathbf{u}h(\mathbf{w}^T \mathbf{x} + \mathbf{b})$$

```
deriv_tanh(x)
reset_parameters()
forward(x, y=None, compute_jacobian=True)
    Forward propagation of flow layers.
```

#### Parameters

- **x** (`torch.Tensor`) – Input data.
- **y** (`torch.Tensor`, *defaults to None*) – Data for conditioning.
- **compute\_jacobian** (`bool`, *defaults to True*) – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in `logdet_jacobian`.

#### Returns z

**Return type** `torch.Tensor`

```
inverse(z, y=None)
```

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

#### Parameters

- **z** (`torch.Tensor`) – Input data.
- **y** (`torch.Tensor`, *defaults to None*) – Data for conditioning.

#### Returns x

**Return type** `torch.Tensor`

```
extra_repr()
```

Set the extra representation of the module

To print customized extra information, you should re-implement this method in your own modules. Both single-line and multi-line strings are acceptable.

## 4.3 Coupling layer

### 4.3.1 AffineCoupling

```
class pixyz.flows.AffineCoupling(in_features, mask_type='channel_wise', scale_net=None,
                                         translate_net=None, scale_translate_net=None, inverse_mask=False)
```

Bases: `pixyz.flows.flows.Flow`

Affine coupling layer

$$\begin{aligned}\mathbf{y}_{1:d} &= \mathbf{x}_{1:d} \\ \mathbf{y}_{d+1:D} &= \mathbf{x}_{d+1:D} \odot \exp(s(\mathbf{x}_{1:d}) + t(\mathbf{x}_{1:d}))\end{aligned}$$

**build\_mask** (*x*)

**Parameters** **x** (*torch.Tensor*) –

**Returns** **mask**

**Return type** *torch.tensor*

## Examples

```
>>> scale_translate_net = lambda x: (x, x)
>>> f1 = AffineCoupling(4, mask_type="channel_wise", scale_translate_
->net=scale_translate_net,
...                                inverse_mask=False)
>>> x1 = torch.randn([1, 4, 3, 3])
>>> f1.build_mask(x1)
tensor([[[[1.]],
<BLANKLINE>
    [[1.]],
<BLANKLINE>
    [[0.]],
<BLANKLINE>
    [[0.]]]])
>>> f2 = AffineCoupling(2, mask_type="checkerboard", scale_translate_
->net=scale_translate_net,
...                                inverse_mask=True)
>>> x2 = torch.randn([1, 2, 5, 5])
>>> f2.build_mask(x2)
tensor([[[[0., 1., 0., 1., 0.],
[1., 0., 1., 0., 1.],
[0., 1., 0., 1., 0.],
[1., 0., 1., 0., 1.],
[0., 1., 0., 1., 0.]]]])
```

**get\_parameters** (*x, y=None*)

### Parameters

- **x** (*torch.tensor*) –
- **y** (*torch.tensor*) –

### Returns

- **s** (*torch.tensor*)
- **t** (*torch.tensor*)

## Examples

```
>>> # In case of using scale_translate_net
>>> scale_translate_net = lambda x: (x, x)
>>> f1 = AffineCoupling(4, mask_type="channel_wise", scale_translate_
->net=scale_translate_net,
...                                inverse_mask=False)
>>> x1 = torch.randn([1, 4, 3, 3])
>>> log_s, t = f1.get_parameters(x1)
>>> # In case of using scale_net and translate_net
```

(continues on next page)

(continued from previous page)

```
>>> scale_net = lambda x: x
>>> translate_net = lambda x: x
>>> f2 = AffineCoupling(4, mask_type="channel_wise", scale_net=scale_net, _translate_net=translate_net,
...                         inverse_mask=False)
>>> x2 = torch.randn([1, 4, 3, 3])
>>> log_s, t = f2.get_parameters(x2)
```

**forward**(*x*, *y*=None, *compute\_jacobian*=True)

Forward propagation of flow layers.

**Parameters**

- **x** (*torch.Tensor*) – Input data.
- **y** (*torch.Tensor*, *defaults to None*) – Data for conditioning.
- **compute\_jacobian** (*bool*, *defaults to True*) – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in `logdet_jacobian`.

**Returns z****Return type** *torch.Tensor***inverse**(*z*, *y*=None)

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

**Parameters**

- **z** (*torch.Tensor*) – Input data.
- **y** (*torch.Tensor*, *defaults to None*) – Data for conditioning.

**Returns x****Return type** *torch.Tensor***extra\_repr()**

Set the extra representation of the module

To print customized extra information, you should re-implement this method in your own modules. Both single-line and multi-line strings are acceptable.

## 4.4 Invertible layer

### 4.4.1 ChannelConv

**class** pixyz.flows.ChannelConv(*in\_channels*, *decomposed*=False)

Bases: pixyz.flows.Flow

Invertible  $1 \times 1$  convolution.**Notes**This is implemented with reference to the following code. <https://github.com/chaiyujin/glow-pytorch/blob/master/glow/modules.py>**get\_parameters**(*x*, *inverse*)

**forward** (*x*, *y*=*None*, *compute\_jacobian*=*True*)

Forward propagation of flow layers.

**Parameters**

- **x** (*torch.Tensor*) – Input data.
- **y** (*torch.Tensor*, *defaults to None*) – Data for conditioning.
- **compute\_jacobian** (*bool*, *defaults to True*) – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in `logdet_jacobian`.

**Returns z**

**Return type** *torch.Tensor*

**inverse** (*x*, *y*=*None*)

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

**Parameters**

- **z** (*torch.Tensor*) – Input data.
- **y** (*torch.Tensor*, *defaults to None*) – Data for conditioning.

**Returns x**

**Return type** *torch.Tensor*

## 4.5 Operation layer

### 4.5.1 Squeeze

```
class pixyz.flows.Squeeze
    Bases: pixyz.flows.flows.Flow

    Squeeze operation.

    c * s * s -> 4c * s/2 * s/2
```

#### Examples

```
>>> import torch
>>> a = torch.tensor([i+1 for i in range(16)]).view(1, 1, 4, 4)
>>> print(a)
tensor([[[[ 1,  2,  3,  4],
          [ 5,  6,  7,  8],
          [ 9, 10, 11, 12],
          [13, 14, 15, 16]]]])
```

```
>>> f = Squeeze()
>>> print(f(a))
tensor([[[[ 1,  3],
          [ 9, 11]]],
<BLANKLINE>
          [[ 2,  4],
          [10, 12]]],
<BLANKLINE>
```

(continues on next page)

(continued from previous page)

```
[[ 5,  7],
 [13, 15]],
<BLANKLINE>
[[ 6,  8],
 [14, 16]]])
```

```
>>> print(f.inverse(f(a)))
tensor([[[[ 1,  2,  3,  4],
          [ 5,  6,  7,  8],
          [ 9, 10, 11, 12],
          [13, 14, 15, 16]]]])
```

**forward** (*x, y=None, compute\_jacobian=True*)  
Forward propagation of flow layers.

#### Parameters

- **x** (*torch.Tensor*) – Input data.
- **y** (*torch.Tensor, defaults to None*) – Data for conditioning.
- **compute\_jacobian** (*bool, defaults to True*) – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in `logdet_jacobian`.

#### Returns z

**Return type** *torch.Tensor*

**inverse** (*z, y=None*)

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

#### Parameters

- **z** (*torch.Tensor*) – Input data.
- **y** (*torch.Tensor, defaults to None*) – Data for conditioning.

#### Returns x

**Return type** *torch.Tensor*

## 4.5.2 Unsqueeze

```
class pixyz.flows.Unsqueeze
Bases: pixyz.flows.operations.Squeeze

Unsqueeze operation.

c * s * s -> c/4 * 2s * 2s
```

#### Examples

```
>>> import torch
>>> a = torch.tensor([i+1 for i in range(16)]).view(1,4,2,2)
>>> print(a)
tensor([[[[ 1,  2],
          [ 3,  4]],
```

(continues on next page)

(continued from previous page)

```

<BLANKLINE>
    [[ 5,   6],
     [ 7,   8]],
<BLANKLINE>
    [[ 9,  10],
     [11,  12]],
<BLANKLINE>
    [[13,  14],
     [15,  16]]])
>>> f = Unsqueeze()
>>> print(f(a))
tensor([[[[ 1,   5,   2,   6],
          [ 9,  13,  10,  14],
          [ 3,   7,   4,   8],
          [11,  15,  12,  16]]]])
>>> print(f.inverse(f(a)))
tensor([[[[ 1,   2],
          [ 3,   4]],
<BLANKLINE>
    [[ 5,   6],
     [ 7,   8]],
<BLANKLINE>
    [[ 9,  10],
     [11,  12]],
<BLANKLINE>
    [[13,  14],
     [15,  16]]])

```

**forward**(*x*, *y*=*None*, *compute\_jacobian*=*True*)

Forward propagation of flow layers.

**Parameters**

- **x** (*torch.Tensor*) – Input data.
- **y** (*torch.Tensor*, *defaults to None*) – Data for conditioning.
- **compute\_jacobian** (*bool*, *defaults to True*) – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in `logdet_jacobian`.

**Returns z****Return type** *torch.Tensor***inverse**(*z*, *y*=*None*)

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

**Parameters**

- **z** (*torch.Tensor*) – Input data.
- **y** (*torch.Tensor*, *defaults to None*) – Data for conditioning.

**Returns x****Return type** *torch.Tensor*

### 4.5.3 Permutation

```
class pixyz.flows.Permutation(permute_indices)
Bases: pixyz.flows.Flow
```

#### Examples

```
>>> import torch
>>> a = torch.tensor([i+1 for i in range(16)]).view(1, 4, 2, 2)
>>> print(a)
tensor([[[[ 1,  2],
          [ 3,  4]],
         <BLANKLINE>
          [[ 5,  6],
           [ 7,  8]],
         <BLANKLINE>
          [[ 9, 10],
           [11, 12]],
         <BLANKLINE>
          [[13, 14],
           [15, 16]]])
>>> perm = [0,3,1,2]
>>> f = Permutation(perm)
>>> f(a)
tensor([[[[ 1,  2],
          [ 3,  4]],
         <BLANKLINE>
          [[13, 14],
           [15, 16]],
         <BLANKLINE>
          [[ 5,  6],
           [ 7,  8]],
         <BLANKLINE>
          [[ 9, 10],
           [11, 12]]])
>>> f.inverse(f(a))
tensor([[[[ 1,  2],
          [ 3,  4]],
         <BLANKLINE>
          [[ 5,  6],
           [ 7,  8]],
         <BLANKLINE>
          [[ 9, 10],
           [11, 12]],
         <BLANKLINE>
          [[13, 14],
           [15, 16]]])
```

**forward** (*x*, *y*=*None*, *compute\_jacobian*=*True*)  
 Forward propagation of flow layers.

#### Parameters

- **x** (*torch.Tensor*) – Input data.
- **y** (*torch.Tensor*, *defaults to None*) – Data for conditioning.
- **compute\_jacobian** (*bool*, *defaults to True*) – Whether to calculate and

store log-determinant Jacobian. If true, calculated Jacobian values are stored in `logdet_jacobian`.

**Returns z**

**Return type** torch.Tensor

**inverse** (*z, y=None*)

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

**Parameters**

- ***z*** (`torch.Tensor`) – Input data.
- ***y*** (`torch.Tensor, defaults to None`) – Data for conditioning.

**Returns x**

**Return type** torch.Tensor

#### 4.5.4 Shuffle

```
class pixyz.flows.Shuffle(in_features)
    Bases: pixyz.flows.operations.Permutation
```

#### 4.5.5 Reverse

```
class pixyz.flows.Reverse(in_features)
    Bases: pixyz.flows.operations.Permutation
```

#### 4.5.6 Flatten

```
class pixyz.flows.Flatten(in_size=None)
    Bases: pixyz.flows.flows.Flow
```

**forward** (*x, y=None, compute\_jacobian=True*)

Forward propagation of flow layers.

**Parameters**

- ***x*** (`torch.Tensor`) – Input data.
- ***y*** (`torch.Tensor, defaults to None`) – Data for conditioning.
- **`compute_jacobian`** (`bool, defaults to True`) – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in `logdet_jacobian`.

**Returns z**

**Return type** torch.Tensor

**inverse** (*z, y=None*)

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

**Parameters**

- ***z*** (`torch.Tensor`) – Input data.
- ***y*** (`torch.Tensor, defaults to None`) – Data for conditioning.

**Returns** `x`  
**Return type** `torch.Tensor`

#### 4.5.7 BatchNorm1d

`class pixyz.flows.BatchNorm1d(in_features, momentum=0.0)`

Bases: `pixyz.flows.flows.Flow`

A batch normalization with the inverse transformation.

#### Notes

This is implemented with reference to the following code. <https://github.com/ikostrikov/pytorch-flows/blob/master/flows.py#L205>

#### Examples

```
>>> x = torch.randn(20, 100)
>>> f = BatchNorm1d(100)
>>> # transformation
>>> z = f(x)
>>> # reconstruction
>>> _x = f.inverse(f(x))
>>> # check this reconstruction
>>> diff = torch.sum(torch.abs(_x-x)).item()
>>> diff < 0.1
True
```

**forward** (`x, y=None, compute_jacobian=True`)

Forward propagation of flow layers.

#### Parameters

- `x (torch.Tensor)` – Input data.
- `y (torch.Tensor, defaults to None)` – Data for conditioning.
- `compute_jacobian (bool, defaults to True)` – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in `logdet_jacobian`.

#### Returns `z`

**Return type** `torch.Tensor`

**inverse** (`z, y=None`)

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

#### Parameters

- `z (torch.Tensor)` – Input data.
- `y (torch.Tensor, defaults to None)` – Data for conditioning.

#### Returns `x`

**Return type** `torch.Tensor`

## 4.5.8 BatchNorm2d

```
class pixyz.flows.BatchNorm2d(in_features, momentum=0.0)
Bases: pixyz.flows.normalizations.BatchNorm1d

A batch normalization with the inverse transformation.
```

### Notes

This is implemented with reference to the following code. <https://github.com/ikostrikov/pytorch-flows/blob/master/flows.py#L205>

### Examples

```
>>> x = torch.randn(20, 100, 35, 45)
>>> f = BatchNorm2d(100)
>>> # transformation
>>> z = f(x)
>>> # reconstruction
>>> _x = f.inverse(f(x))
>>> # check this reconstruction
>>> diff = torch.sum(torch.abs(_x-x)).item()
>>> diff < 0.1
True
```

## 4.5.9 ActNorm2d

```
class pixyz.flows.ActNorm2d(in_features, scale=1.0)
Bases: pixyz.flows.flows.Flow
```

Activation Normalization Initialize the bias and scale with a given minibatch, so that the output per-channel have zero mean and unit variance for that. After initialization, *bias* and *logs* will be trained as parameters.

### Notes

This is implemented with reference to the following code. <https://github.com/chaiyujin/glow-pytorch/blob/master/glow/modules.py>

```
initialize_parameters(x)

forward(x, y=None, compute_jacobian=True)
Forward propagation of flow layers.
```

### Parameters

- **x** (`torch.Tensor`) – Input data.
- **y** (`torch.Tensor, defaults to None`) – Data for conditioning.
- **compute\_jacobian** (`bool, defaults to True`) – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in `logdet_jacobian`.

### Returns z

**Return type** `torch.Tensor`

**inverse**(*x*, *y*=None)

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

**Parameters**

- ***z*** (*torch.Tensor*) – Input data.
- ***y*** (*torch.Tensor*, *defaults to None*) – Data for conditioning.

**Returns *x*****Return type** *torch.Tensor*

#### 4.5.10 Preprocess

**class pixyz.flows.Preprocess**

Bases: *pixyz.flows.flows.Flow*

**static logit**(*x*)**forward**(*x*, *y*=None, *compute\_jacobian=True*)

Forward propagation of flow layers.

**Parameters**

- ***x*** (*torch.Tensor*) – Input data.
- ***y*** (*torch.Tensor*, *defaults to None*) – Data for conditioning.
- ***compute\_jacobian*** (*bool*, *defaults to True*) – Whether to calculate and store log-determinant Jacobian. If true, calculated Jacobian values are stored in *logdet\_jacobian*.

**Returns *z*****Return type** *torch.Tensor***inverse**(*z*, *y*=None)

Backward (inverse) propagation of flow layers. In this method, log-determinant Jacobian is not calculated.

**Parameters**

- ***z*** (*torch.Tensor*) – Input data.
- ***y*** (*torch.Tensor*, *defaults to None*) – Data for conditioning.

**Returns *x*****Return type** *torch.Tensor*

# CHAPTER 5

---

## pixyz.utils

---

`pixyz.utils.set_epsilon(eps)`

Set a *epsilon* parameter.

**Parameters** `eps` (*int or float*) –

### Examples

```
>>> from unittest import mock
>>> with mock.patch('pixyz.utils._EPSILON', 1e-07):
...     set_epsilon(1e-06)
...     epsilon()
1e-06
```

`pixyz.utils.epsilon()`

Get a *epsilon* parameter.

**Returns**

**Return type** *int or float*

### Examples

```
>>> from unittest import mock
>>> with mock.patch('pixyz.utils._EPSILON', 1e-07):
...     epsilon()
1e-07
```

`pixyz.utils.get_dict_values(dicts, keys, return_dict=False)`

Get values from *dicts* specified by *keys*.

When *return\_dict* is True, return values are in dictionary format.

**Parameters**

- **dicts** (*dict*) –
- **keys** (*list*) –
- **return\_dict** (*bool*) –

**Returns**

**Return type** dict or list

### Examples

```
>>> get_dict_values({ "a":1, "b":2, "c":3}, [ "b"])
[2]
>>> get_dict_values({ "a":1, "b":2, "c":3}, [ "b", "d"], True)
{'b': 2}
```

`pixyz.utils.delete_dict_values (dicts, keys)`

Delete values from *dicts* specified by *keys*.

**Parameters**

- **dicts** (*dict*) –
- **keys** (*list*) –

**Returns new\_dicts**

**Return type** dict

### Examples

```
>>> delete_dict_values({ "a":1, "b":2, "c":3}, [ "b", "d"])
{'a': 1, 'c': 3}
```

`pixyz.utils.detach_dict (dicts)`

Detach all values in *dicts*.

**Parameters** **dicts** (*dict*) –

**Returns**

**Return type** dict

`pixyz.utils.replace_dict_keys (dicts, replace_list_dict)`

Replace values in *dicts* according to *replace\_list\_dict*.

**Parameters**

- **dicts** (*dict*) – Dictionary.
- **replace\_list\_dict** (*dict*) – Dictionary.

**Returns replaced\_dicts** – Dictionary.

**Return type** dict

## Examples

```
>>> replace_dict_keys({ "a":1, "b":2, "c":3}, { "a":"x", "b":"y"})
{'x': 1, 'y': 2, 'c': 3}
>>> replace_dict_keys({ "a":1, "b":2, "c":3}, { "a":"x", "e":"y"}) # keys of `replace_
->list_dict` 
{'x': 1, 'b': 2, 'c': 3}
```

`pixyz.utils.replace_dict_keys_split(dicts, replace_list_dict)`

Replace values in `dicts` according to `replace_list_dict`.

Replaced dict is splitted by `replaced_dict` and `remain_dict`.

### Parameters

- `dicts` (`dict`) – Dictionary.
- `replace_list_dict` (`dict`) – Dictionary.

### Returns

- `replaced_dict` (`dict`) – Dictionary.
- `remain_dict` (`dict`) – Dictionary.

## Examples

```
>>> replace_list_dict = { 'a': 'loc' }
>>> x_dict = { 'a': 0, 'b': 1 }
>>> print(replace_dict_keys_split(x_dict, replace_list_dict))
({'loc': 0}, {'b': 1})
```

`class pixyz.utils.FrozenSampleDict(dict_)`

Bases: `object`

`pixyz.utils.lru_cache_for_sample_dict(maxsize=0)`

Memoize the calculation result linked to the argument of sample dict. Note that dictionary arguments of the target function must be sample dict.

**Parameters** `maxsize` (*cache size prepared for the target method*) –

### Returns

**Return type** decorator function

## Examples

```
>>> import time
>>> import torch.nn as nn
>>> import pixyz.utils as utils
>>> # utils.CACHE_SIZE = 2 # you can also use this module option to enable all_
->memoization of distribution
>>> import pixyz.distributions as pd
>>> class LongEncoder(pd.Normal):
...     def __init__(self):
...         super().__init__(var=['x'], cond_var=['y'])
...         self.nn = nn.Sequential(*[nn.Linear(1, 1) for i in range(10000)])
...     def forward(self, y):
```

(continues on next page)

(continued from previous page)

```

...
    return {'loc': self.nn(y), 'scale': torch.ones(1,1)}
...
@lru_cache_for_sample_dict(maxsize=2)
...
def get_params(self, params_dict={}, **kwargs):
    return super().get_params(params_dict, **kwargs)
>>> def measure_time(func):
...
    start = time.time()
...
    func()
...
    elapsed_time = time.time() - start
...
    return elapsed_time
>>> le = LongEncoder()
>>> y = torch.ones(1, 1)
>>> t_sample1 = measure_time(lambda:le.sample({'y': y}))
>>> print ("sample1:{0}".format(t_sample1) + "[sec]") # doctest: +SKIP
>>> t_log_prob = measure_time(lambda:le.get_log_prob({'x': y, 'y': y}))
>>> print ("log_prob:{0}".format(t_log_prob) + "[sec]") # doctest: +SKIP
>>> t_sample2 = measure_time(lambda:le.sample({'y': y}))
>>> print ("sample2:{0}".format(t_sample2) + "[sec]") # doctest: +SKIP
>>> assert t_sample1 > t_sample2, "processing time increases: {0}".format(t_
->sample2 - t_sample1)

```

pixyz.utils.**tolist**(*a*)

Convert a given input to the dictionary format.

**Parameters** *a* (*list or other*) –**Returns****Return type** list

## Examples

```

>>> tolist(2)
[2]
>>> tolist([1, 2])
[1, 2]
>>> tolist([])
[]

```

pixyz.utils.**sum\_samples**(*samples*)

Sum a given sample across the axes.

**Parameters** *samples* (*torch.Tensor*) – Input sample. The number of this axes is assumed to be 4 or less.**Returns** Sum over all axes except the first axis.**Return type** torch.Tensor

## Examples

```

>>> a = torch.ones([2])
>>> sum_samples(a).size()
torch.Size([2])
>>> a = torch.ones([2, 3])
>>> sum_samples(a).size()

```

(continues on next page)

(continued from previous page)

```
torch.Size([2])
>>> a = torch.ones([2, 3, 4])
>>> sum_samples(a).size()
torch.Size([2])
```

`pixyz.utils.print_latex(obj)`

Print formulas in latex format.

**Parameters** `obj` (`pixyz.distributions.distributions.Distribution,`  
`pixyz.losses.losses.Loss or pixyz.models.model.Model.)-`

`pixyz.utils.convert_latex_name(name)`
